Certification

Pursuant to the requirements of the Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2), adopted May 19, 1995, which states:

Interpretation of geologic and hydrogeologic data shall be prepared by a professional geologist licensed in this Commonwealth.

I hereby attest that, as a Professional Geologist licensed in the Commonwealth of Pennsylvania, I am familiar with, and have reviewed and/or prepared the interpretation of the geology and hydrogeology presented in the attached report entitled, *Site Characterization Report – Tank Group 07, Former Philadelphia Energy Solutions Refinery, 3144 West Passyunk Avenue, Philadelphia, Pennsylvania*, dated February 2023.

Based on the available data represented in the report, I believe that the geologic and hydrogeologic interpretations made herein are reasonable and accurate.

Alexander J. Strohl, PG
Senior Staff Geologist

February 6, 2023

Date

1 Introduction

Terraphase Engineering, Inc. (Terraphase) has prepared this *Site Characterization Report* (Report), on behalf of Philadelphia Energy Solutions Refining and Marketing LLC (PESRM), to detail the results of the Site Assessment and Site Characterization activities at Tank Group 07 (the Site) which is located within the Former Philadelphia Energy Solutions refinery facility (Facility). The Facility, which is undergoing closure activities in preparation for redevelopment, is located at 3144 West Passyunk Avenue, Philadelphia, Pennsylvania (**Figure 1**). Remediation activities are being conducted at the Facility under the Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2) by both PESRM and Evergreen Resources Group, LLC (Evergreen)¹ in accordance with the 2012 Buyer-Seller Agreement and the 2020 First Amendment to that Agreement.

The Site Assessment and Site Characterization activities described in this Report were performed in accordance with the applicable provisions of The Storage Tank and Spill Prevention Act (Act 32), Title 25 of the Pennsylvania Code (25 PA Code) Chapter 245 (Subchapter D), and Terraphase’s (2021) *Aboveground Storage Tank Closure Work Plan* (Work Plan), which was approved by the Pennsylvania Department of Environmental Protection (PADEP) on April 23, 2021. As discussed in the Work Plan, closure of the above ground storage tanks (ASTs) under Act 32 is being pursued through a group closure process, in which ASTs in the same general area (e.g., tank farm) have been demolished, removed, investigated, and evaluated at about the same time. Demolition of the tanks has been proceeding in phases from the north to the south with eight Tank Groups in all.

Tank Group 07 (**Figure 2**) is located within a larger area of the Facility referred to as the Girard Point Refinery. Evergreen is currently engaged in characterization and remediation work at the Facility under the Pennsylvania One Cleanup Program under the oversight of the PADEP and the United States Environmental Protection Agency (USEPA) (eFACTS PF No. 757108). In its associated documentation, Evergreen has identified the Tank Group 07 portions of the Girard Point Refinery as Area of Interest (AOI) 6. The specific ASTs addressed in this Report are shown on **Figure 3** and listed in **Table 1**.

This Report was prepared in accordance with Act 32 and 25 PA Code Chapter 245 (Subchapter D) and provides a summary of the Site Assessment and Site Characterization activities that were performed following the identification of potential releases to the environment during the demolition and removal of the Tank Group 07 ASTs. It also demonstrates that adequate characterization has been performed to evaluate whether remedial action is warranted and indicates that PESRM will pursue closure under the Site-Specific Standard (SSS).

Section 2 provides the site setting and includes a description of the Site and operational/usage history of the ASTs and information regarding site topography, geology, and hydrogeology. Section 3 includes a summary of current and reasonably anticipated future land and groundwater use at and in the vicinity of

¹ Evergreen Resources Management Operations, a series of Evergreen Resources Group, LLC, is managing the legacy remedial work for Philadelphia Refinery Operations, a series of Evergreen Resources Group, LLC (“Evergreen”) and Sunoco (R&M), LLC. For clarity, Sunoco, Inc. n/k/a ETC Sunoco Holdings LLC, Sunoco, Inc. (R&M) f/k/a Sunoco (R&M), LLC n/k/a Energy Transfer (R&M), LLC effective 4/19/2021 and Evergreen shall be referred to collectively as “Evergreen” in this Report.

the Site and the selected standards. Section 4 includes a summary of known past releases to the environment in the area and subsequent investigation and remedial activities to address these releases. Section 5 discusses the tank infrastructure and removal. Sections 6 and 7 discuss the Site Assessment and Site Characterization, respectively. Section 8 presents a summary of the Risk Assessment conclusions performed for the Tank Group. An Ecological Screening Evaluation is presented in Section 9. A summary of the Report and its conclusions are presented in Section 10.

2 Site Setting

The Facility, a former 1,300-acre refinery, is currently undergoing decommissioning to support redevelopment. The Site² is approximately 21 acres in size and is located within the Girard Point Refinery, an area that is also referred to as AOI 6 by Evergreen as part of their One Cleanup Program effort. The Site is located north of the Platt Bridge, between Lanier Street and the Schuylkill River. Prior to demolition, Tank Group 07 consisted of six separate areas containing tanks located in the central portion of the Girard Point Refinery. The areas are separated by facility buildings, large piping structures, and plant access roadways. Except for the asphalt roadways and parking areas that pass through the portions of Tank Group 07, and the tank foundations themselves, the area is not covered by hardscape.

The ASTs addressed in this Report are listed in **Table 1**. Nine other ASTs, not subject to this closure effort, were previously located within Tank Group 07.

Figure 3 provides a layout of Tank Group 07.

2.1 Operational History/Usage of the Tanks

The Facility operated as a petroleum refinery between 1860 and 2019. The refinery ceased operations in 2019. The demolition and decommissioning of the subject ASTs began in September 2021. Prior to demolition, the primary products held within these tanks were: benzene (GP R 790, GP R 791, GP R 798, and GP R 799), fresh caustic (GP R 1088), cumene (GP R 792 and GP R 793), distillate, main frac bottoms (GP R 494), recovered oil (GP U 767), tetraethylene glycol (TEG) (GP R 794), and UDEX Feed (GP R 1116 and GP R 1117). Additional details regarding the size, contents, and construction of the tanks are provided in **Table 1**.

2.2 Topography

Topography at the Site is generally flat except for containment berms constructed around the tank areas to provide containment in the event of a release. Regional topography slopes gently to the west towards the Schuylkill River, the nearest water body to the Site. The ground surface elevation at the Site is approximately 7 feet (ft) above mean sea level.³

2.3 Regional Geology and Hydrogeology

The Facility is located within the Atlantic Coastal Plain Physiographic Province of Pennsylvania. The Atlantic Coastal Plain is a physiographic province that is defined as having a flat topography, underlain by unconsolidated sediments that thicken to the southeast. The Coastal Plain deposits are sand, gravel, silt, and clay which drape over crystalline igneous and metamorphic rocks. In general, the resulting sediments are approximately 250 ft thick along the Delaware River. These sediments unconformably

² Tank Group 07 consists of a tank farm referred to by the Facility as the North Tank Farm.

³ North American Vertical Datum of 1988.

overlie much older, very complexly deformed rocks of the Piedmont physiographic province. The Coastal Plain deposits in the vicinity of the Facility consist of anthropogenic fill underlain by quaternary deposits.

Much of the Facility and surrounding area is underlain by historical fill material, which was placed for the purpose of reclaiming lowlands along the banks of the tidal Delaware and Schuylkill Rivers during industrialization. Below the fill material, sediments consist of gray, muddy deposits with occasional sand, gravel, and organic-rich lenses. These sediments were deposited in floodplain, channel, and marsh environments through the Holocene. The most recent deposits are poorly consolidated and below the phreatic surface of the unconfined aquifer as a result of their relatively young geologic age and position along the Schuylkill River (tributaries and creeks). Below the Holocene deposits is a Pleistocene glacial outwash deposit, commonly referred to as the “Trenton Gravel” along the Delaware River valley. Cretaceous-age sand and clay units making up the Potomac-Raritan-Magothy aquifer system underly the Pleistocene deposits.

The sedimentary record near the Site consists of a complex series of water-bearing sand units which can comprise one or more hydrostatic units. Previous investigations conducted at the Facility have identified two saturated zones, including an unconfined shallow groundwater unit (occurring within the Holocene and Trenton Gravel deposits) and a deep groundwater unit known as the Farrington Sand, which is part of the Potomac-Raritan-Magothy aquifer system. The deeper groundwater unit is separated by a clay unit; as such, the deeper groundwater has been classified as a semi-confined aquifer. Groundwater is first encountered generally at the Facility at a depth approximately 0.5 to 6 ft below ground surface (bgs; GHD 2017a). **Appendix A** provides select figures from the *Remedial Investigation Report*, AOI 6 (AOI 6 RIR; GHD 2017a) and the *Sitewide Fate and Transport Remedial Investigation Report* (Sitewide Fate and Transport RIR, Stantec 2022) for reference including Figure 8 from the AOI 6 RIR which provides a detailed cross section of the subsurface in this area.

2.4 Local Geology and Hydrogeology

During the Site Assessment and Site Characterization, soil at the Site was primarily investigated within the upper 5 ft, although Site Characterization monitoring wells were advanced to a maximum depth of 13 ft. Anthropogenic fill up to 15 ft thick was observed in soil cores collected from most of the soil borings installed in Tank Group 07. Soil beneath the fill layer generally consists of brown to gray sand, clay, and silt. During Site Assessment soil sampling, saturated soil was not encountered from 0-5 ft bgs. Due to seasonal change in groundwater elevations, saturated soils were encountered during Site Characterization sampling as shallow as 0.5 feet bgs.

Historically, unconfined aquifer groundwater has been first encountered in Tank Group 07 at a depth of approximately 0.5 to 6 ft bgs (GHD 2017a). During Site Characterization activities, groundwater was encountered between approximately 0.5 and 6 ft bgs.

Groundwater at the Girard Point Refinery has historically been interpreted to flow toward the Schuylkill River. Based on Figure 14 of the AOI 6 RIR (GHD 2017a) and Figure 3-29 of the Sitewide Fate and Transport RIR (Stantec 2022) included in **Appendix A**, unconfined aquifer groundwater flow within Tank Group 07 appears to be southwest.

3 Selection of Standards

This section discusses the selection of remediation standards by PESRM for Tank Group 07. Related, this section also discusses planned land and groundwater use at the Site and describes derivation of risk-based screening levels (RBSLs) that are used to streamline investigation decisions during the Site Characterization.

3.1 Land and Groundwater Use

As noted in the parcel map included in **Appendix B** and as captured in the conceptual imagery developed by Hilco Redevelopment Partners (<https://www.thebellwetherdistrict.com/>), the area encompassing Tank Group 07 is being redeveloped into a state-of-the-art, multimodal industrial park and life sciences campus with ancillary rail infrastructure, energy infrastructure, marine capabilities, and commercial uses. Current and reasonably anticipated future land use in the area of Tank Group 07 is non-residential. Following redevelopment, much of the area is also expected to be covered by hardscape (e.g., building pads, drive aisles, parking lots, roadways) or other features that will function as barriers to direct contact exposure.

As discussed with PADEP, vapor intrusion is not considered in evaluating the adequacy of sampling performed during Site Characterization. However, the risk assessment described in Section 8 has evaluated the existing Site Assessment and Site Characterization data with consideration for current and reasonably expected future exposure scenarios (including vapor intrusion) and has identified areas of the Tank Group where site-related conditions could pose an unacceptable risk that would warrant risk management action (i.e., remediation, establishment of institutional or engineering controls). Once redevelopment plans have been finalized, additional investigation and/or evaluation of vapor intrusion exposure will be conducted to further evaluate whether conditions could pose an unacceptable risk to future building occupants such that risk management action (e.g., remediation, vapor mitigation) is warranted. PESRM will conduct this additional VI evaluation outside of this tank closure work. The VI evaluation should not delay regulatory closure of the tanks. PESRM has an obligation to evaluate or mitigate the vapor intrusion pathway under the 2020 Buyer-Seller Agreement Amendment.

The unconfined aquifer is not used for a municipal or nearby communal potable water supply and future potable use of the unconfined aquifer is not reasonably expected, as documented by Evergreen (Stantec 2021 AOI 9 Second Remedial Investigation Report Addendum and Evergreen 2021 Public Involvement Remedial Investigation Report Response Letter to PADEP). While the risk assessment does not consider current off-facility groundwater to be a source of nonpotable water based upon the results of Evergreen's (2021) assessments, the risk assessment does assume that off-facility groundwater could be used in the future as a source of nonpotable water.

3.2 Selected Standard

PESRM has selected the SSS to attain closure for Tank Group 07. As described in Section 6, the comparison of the Site Assessment data against Non-Residential Statewide Health Standard (SHS) Medium Specific Concentrations (MSCs), in accordance with PADEP's (2022) *Site Assessment Sampling*

Requirements at Regulated Storage Tank System Closures and the Work Plan, was used to identify whether releases could have occurred from the ASTs in Tank Group 07. PESRM subsequently elected to seek closure of the tanks under the SSS. To support attainment of the SSS, a Site-Specific Human Health Risk Assessment (the Risk Assessment) has been conducted to evaluate the potential significance of identified releases in Tank Group 07 and determine whether constituent of potential concern (COPC) concentrations could pose unacceptable risk and/or hazard to human health, and whether such conditions would warrant management via remedial action to demonstrate attainment of the SSS. The outcome of the Risk Assessment is presented in Section 8 and described in detail in **Appendix C**.

3.3 Derivation of Risk-Based Screening Levels

As part of this Report, RBSLs were derived in accordance with PADEP and USEPA risk assessment guidance and are summarized in **Table 2**. The RBSLs were used to help to segregate soil and groundwater sampling data into those that indicate a higher potential for health significance from those that indicate a lower potential. In addition, COPC concentrations have been delineated to the site specific RBSLs. This delineation indicates that the Site has been adequately characterized for a site-specific risk assessment.

The RBSLs are developed with consideration for current and reasonably expected future land and groundwater use at and in the immediate vicinity of the Facility.

RBSLs are developed for the following exposure scenarios⁴:

Soil Exposure

- Routine worker exposure to COPCs in soil via direct contact⁵ and vapor intrusion
- Construction worker exposure to COPCs in soil via direct contact
- Migration of COPCs in soil to groundwater⁶

Groundwater Exposure

- Routine worker exposure to COPCs in groundwater via volatilization to outdoor air and vapor intrusion
- Construction worker exposure to COPCs in groundwater via direct contact
- Off-site resident exposure to COPCs in groundwater via vapor intrusion
- Exposure of all receptors to COPCs in groundwater via nonpotable groundwater use
- Migration of COPCs in groundwater to surface water

⁴ Exposure to COPCs in soil and groundwater by hypothetical future residents was not evaluated because residential use is not a current or reasonably expected future use and because residential use is prohibited at the Property by multiple mechanisms.

⁵ Includes incidental ingestion and dermal contact with COPCs in soil and inhalation of COPCs in soil-derived vapor and particulates.

⁶ Uses groundwater RBSL as target groundwater concentrations.

RBSLs are calculated for each of the COPCs that have been included in the soil and groundwater sampling performed by PESRM. A list of these COPCs is provided in **Table 2**.

The general assumptions used in the derivation of the RBSLs are summarized in the Risk Assessment (**Appendix B of Appendix C**). Human health-based RBSLs are calculated at a target cancer risk level of 1×10^{-5} and a target noncancer hazard quotient of 0.1. The target cancer risk level and target noncancer hazard quotient is used with consideration for the risk management goals established in Section 250.402(b) for attainment of the Site-Specific Standard (i.e., a cumulative excess cancer risk greater than 1×10^{-4} and a noncancer hazard index greater than 1⁷). For efficiency, the RBSLs are developed in a manner that allows them to be used site-wide to complete Site Characterization at each area (e.g., Tank Group).

The RBSLs are not cleanup standards. The identification of concentrations greater than RBSLs does not, on its own, indicate that an unacceptable risk to human health exists. Rather, concentrations greater than RBSLs indicate that additional evaluation is warranted to (1) determine if interim measures are necessary to abate an imminent hazard; (2) determine whether additional site characterization is needed to confirm the sources of contamination, identify the regulated substances involved and the extent of migration of those regulated substances in environmental media, and evaluate the fate and transport of these substances, if needed; (3) perform a site-specific risk assessment, if desired; and (4) as needed, provide sufficient information to allow for the development of a remedial action plan or remedy design.

⁷ As estimated from exposure to COPCs with the same target organ or target effect.

4 Known Past Releases to the Environment

The presence of constituents in soil above the RBSLs in the Tank Group 07 area may be associated with releases from ASTs or other potential sources unrelated to the ASTs. These releases include those identified historically (prior to Tank Group 07 Site Assessment and Site Characterization activities) by Evergreen or those identified recently but unrelated to tanks in Tank Group 07 by PESRM. This section provides a discussion of the past releases and potential other sources of contamination.

The AOI 6 RIR (GHD 2017a), prepared on behalf of Evergreen, notes historical investigations relating to past releases of petroleum products in the vicinity of Tank Group 07. In some cases, these releases have resulted in contamination of groundwater (including the identification of light non-aqueous phase liquid [LNAPL]) that is present or that has migrated to within the bounds of Tank Group 07.

The AOI 6 RIR identified three historical releases from previously closed ASTs within Tank Group 07 (Incident Nos. 45692 [GP R 81], 4844 [GP R 676], and 29122 [GP R 797]). The *Site Characterization Report/Remedial Action Completion report for Aboveground Storage Tanks T 81, 676, and 797* (GHD 2017b) was submitted for these historical releases, allowing for them to be addressed under Act 2. PADEP approved the AOI 6 RIR (GHD 2017a) in 2018. These release incidents will be closed following the approval of an Act 2 Final Report.

4.1 Pre-existing Contamination

Environmental sampling has been conducted at the Facility since as early as 1988. This section provides a summary of historical sampling results in and around Tank Group 07 and a comparison to RBSLs.

4.1.1 Soil

Historical sampling (prior to PESRM Site Assessment activities) in Tank Group 07 has included soil samples which have been analyzed for specific volatile organic compounds (VOCs), semi-volatile organic compounds, and metals. As discussed in Section 1.5 of the AOI 6 RIR, the list of constituents of concern (COCs) which are included in sampling performed by Evergreen as part of the site-wide approach for the Facility under the One Cleanup Program, are referred to as the Evergreen Petroleum Short List and Comprehensive List. The Comprehensive List, which encompasses the Petroleum Short List, is shown on **Table 3**.

As presented on **Table 4a**, the maximum detected concentrations of constituents in historical samples were compared to the RBSLs derived by Terraphase. An evaluation of the concentrations of constituents in historical samples compared to the RBSLs indicates the following:

- Lead and naphthalene have been detected historically in soil in the area at concentrations greater than the Routine Worker Direct Contact RBSLs.
- Benzene, 1,2,4-trimethylbenzene (1,2,4-TMB), xylenes (total), naphthalene, and lead have been detected historically in soil in the area at concentrations greater than the Construction Worker Direct Contact RBSLs.

- Lead and naphthalene have been detected historically in soil in the area at concentrations greater than the soil Migration to Groundwater (MtGW) RBSLs.

Table 4a summarizes additional information for these historical soil sampling results including number of detections, range of detected concentrations, and ratios of the maximum detected concentrations to the RBSLs. **Figure 4a** presents the spatial distribution of historical soil concentrations above these RBSLs. **Appendix D** provides tables of these historical soil sampling results.

Historical sampling has identified concentrations of constituents exceeding RBSLs in soil in the vicinity of previously closed tank GP C2 797 (benzene, benzo(a)pyrene [B(a)P], cumene, naphthalene, toluene, and xylenes (total)). In addition, historical sampling identified concentrations of constituents near currently assessed tanks GP R 79A (naphthalene), GP R 1088 (lead), and GP R 790, GP R 791, GP R 792, GP R 793, GP R 796, GP R 798, and GP R 799 (benzene, B(a)P, cumene, naphthalene, toluene, and xylenes (total)).

With consideration for the closure of the Tank Group 07 ASTs, these sampling results have been included in evaluating whether the soil sampling data generated during the Site Assessment and Site Characterization indicate evidence of new releases to the environment from the tanks, or whether the nature and extent of contamination identified during the Site Assessment and Site Characterization is consistent with known historical soil quality.

4.1.2 Groundwater

More than 30 groundwater monitoring or recovery wells have been installed within and near Tank Group 07 as part of historical environmental sampling at the Facility. **Table 4b** summarizes additional information for these historical groundwater sampling results including number of detections, range of detected concentrations, and ratios of the maximum detected concentrations to the RBSLs. As discussed in the AOI 6 (GHD 2017a) and the Sitewide Fate and Transport (Stantec 2022) RIRs, of the list of site-related constituents identified in groundwater, benzene was chosen as the primary chemical (qualitative proxy) for other constituents because of its water solubility, potential to be mobile in groundwater, and persistence in groundwater at and near the Facility.

Figure 19 of the AOI 6 RIR (GHD 2017a) shows the distribution of benzene in groundwater near Tank Group 07. For expediency, a copy is included in **Appendix A**, and the figure has been amended to identify the location of Tank Group 07.

Figure 4b depicts the wells in Tank Group 07 with identified historical (prior to PESRM Site Characterization activities) dissolved phase groundwater contamination at concentrations greater than RBSLs. The estimated extent of LNAPL observed is also presented. As shown on Figure 19 of the AOI 6 RIR, a large dissolved-phase benzene plume exists beneath the central and southern portion of Tank Group 07, along with three smaller plumes to the north and the west. Since as early as 2001, LNAPL plumes have also been identified at and near Tank Group 07. Figure 17 of the AOI 6 RIR depicts the LNAPL identified during gauging conducted in May 2017. For mapping purposes, LNAPL has been generally characterized into the following categories: light, middle, and heavy petroleum distillates.

As part of remedial action, a LNAPL recovery system was installed in 2001 in the vicinity of Tank Group 07. The 27 Pump House Passive Remediation System, which is adjacent to the southeast of the

central portion of Tank Group 07, was operated by Evergreen until September 2010. The system consisted of a total fluids recovery system and was used to extract contaminated groundwater and LNAPL from a series of recovery wells. Recovered LNAPL was discharged to a holding tank and recovered groundwater was discharged to a nearby facility sewer line for onsite treatment. Following the system's shutdown in 2010, passive recovery via sorbent socks and bailers was conducted until January 2015.

Groundwater in the lower aquifer has been investigated but contamination has not been identified in Tank Group 07 at concentrations greater than the RBSLs.

These historical sampling results have been considered in evaluating Site Assessment and Site Characterization data for Tank Group 07.

5 Tank Infrastructure and Removal

In accordance with the Work Plan, Northstar Contracting Group, Inc. and its subcontractor, JD2 Environmental, Inc., a PADEP-certified Aboveground Field Constructed Storage Tank System Removal contractor, was retained by PESRM to perform tank demolition and handling, including (1) hazard recognition and abatement; (2) removal and handling of vapors, product, wastewaters, and accumulated sludges; (3) overseeing or verifying cleaning of the storage tank system; (4) dismantling the AST; and (5) removal of ancillary equipment and piping.

The demolition of the following ASTs began in September 2021 and was completed in July 2022:

- GP R 1117 (PADEP No. 005A)
- GP R 791 (PADEP No. 006A)
- GP R 798 (PADEP No. 007A)
- GP R 494 (PADEP No. 029A)
- GP R 1116 (PADEP No. 030A)
- GP R 1088 (PADEP No. 033A)
- GP R 790 (PADEP No. 034A)
- GP R 792 (PADEP No. 035A)
- GP R 793 (PADEP No. 036A)
- GP R 794 (PADEP No. 037A)
- GP R 799 (PADEP No. 039A)
- GP U 767 (PADEP No. 046A)

During the removal, it was determined that GP R 792, GP R 794, and GP R 1116 had double bottoms. Double bottoms are forms of secondary containment located under the tanks that allow for visual inspection and potential repair to any observed leaks. PESRM retained ENTACT to remove the double bottoms at the three tanks. Removal was completed in August 2022.

On behalf of PESRM, JD2 Environmental, Inc. submitted to PADEP the required tank registration amendments, copies of which are provided as **Appendix E**.

The Aboveground Storage Tank System Closure Report forms (2630-FM-BECB0514) are included as **Appendix F**.

6 Site Assessment

This section discusses the sample collection methods used and sample analyses performed during the Site Assessment. The soil sampling was completed by Ransom Consulting, LLC (Ransom) and their subcontractor TPI Environmental, LLC (TPI).

As discussed in the Work Plan, when no evidence of a release to the environment was identified during Tank Group 07 AST removal, ASTs were subject to Site Assessment sampling using a grid-based approach with additional samples biased toward the locations of pipe connections or other key infrastructure. Sampling was conducted during multiple mobilizations as the tanks were being demolished and the ground became available for sampling. The first mobilization was on July 18, 2022, and the last mobilization was completed on October 21, 2022, after the removal of double bottoms.

In total, 95 soil borings were installed and 108 soil samples were collected during the Site Assessment. **Figure 5a** shows the location of each of the Site Assessment soil borings.

6.1.1 Sample Collection Methods

Prior to the initiation of the sampling activities, the Pennsylvania One Call System (811 Dig Safe) was contacted to identify underground utilities at the Site. In addition, a review of available information provided by facility representatives regarding the presence/absence of underground utilities was used in the selection of sampling locations. Finally, a private locate was performed using geophysical and electromagnetic techniques to identify potential utilities or subsurface structures at proposed drilling locations.

Soil borings were completed using direct-push (i.e., Geoprobe) drilling or hand auger methods and advanced through the top 5 ft of soil. Continuous soil cores were collected, and field screened using a photoionization detector (PID) to identify potentially impacted zones. Soil sampling intervals were selected based on the results of field screening (i.e., staining, odors, and elevated PID readings). Where potentially impacted materials were not encountered, discrete samples were collected at a depth of 3.0-3.5 ft bgs consistent with the Confirmatory Sampling Protocol detailed in PADEP's (2017) *Closure Requirements for Aboveground Storage Tank Systems*. The approach is consistent with PADEP guidance as their language requires sampling "**at least one foot below underground product piping, two feet below product dispensers, remote fills or containment structures and aboveground product lines for ASTs, and three feet below the tank.**" Where fill was observed, samples of the fill were collected if it consisted of soil or soil-like material. Groundwater was not encountered during the Site Assessment.

Appendix G provides copies of the boring logs that describe the soil cores.

6.1.2 Sample Analyses

The analysis selected for each soil sample was based on the AST contents as prescribed by PADEP's Short List of Petroleum Products inventory (Table III-5 of the *Land Recycling Program Technical Guidance Manual* [January 2019]). As shown on **Table 1**, for these 12 ASTs, analytes included one or a combination of the following short lists, based on historical tank contents:

- **Short List 1.** *Leaded Gasoline, Aviation Gasoline and Jet Fuel:* benzene, toluene, ethyl benzene, xylenes (total), cumene, naphthalene, 1,2,4-TMB, 1,3,5-TMB, 1,2-dichloroethane, 1,2-dibromoethane, and lead.
- **Short List 2.** *Unleaded Gasoline:* benzene, toluene, ethyl benzene, xylenes (total), cumene, MTBE, naphthalene, 1,2,4-TMB, and 1,3,5-trimethyl benzene (1,3,5-TMB).
- **Short List 3.** *Kerosene, Fuel Oil No. 1:* benzene, toluene, ethyl benzene, cumene, MTBE, naphthalene, 1,2,4-TMB, and 1,3,5-TMB.
- **Short List 4.** *Diesel Fuel and Fuel Oil No. 2:* benzene, toluene, ethyl benzene, cumene, MTBE, naphthalene, 1,2,4-TMB, and 1,3,5-TMB.
- **Short List 5.** *Fuel Oil Nos. 4, 5, and 6, and Lubricating Oils and Fluids:* benzene, naphthalene, fluorene, anthracene, phenanthrene, pyrene, benzo(a)anthracene (B[a]A), chrysene, benzo(b)fluoranthene (B[b]F), benzo(a)pyrene (B[a]P), and benzo(g,h,i)perylene.
- **Short List 6.** *Waste Oil:* benzene, toluene, ethyl benzene, cumene, naphthalene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, benzo(g,h,i)pyrene, and lead.

VOCs were analyzed via USEPA Method 8260B. Samples for semi-volatile organic compounds were analyzed via Method 8270C. Samples for lead were analyzed via USEPA Method 6010B. Additionally, TEG was analyzed for one tank via USEPA Method 8015D and pH was analyzed for one tank containing Fresh Caustic via USEPA Method 9045D.

Laboratory analytical services were provided by Alpha Analytical, Inc. of Westborough, Massachusetts, which is a PADEP-certified laboratory. Additionally, laboratory analytical services were provided by SGS North America, Inc., a PADEP-certified laboratory located in Savannah, Georgia, for the limited set of TEG analyses. Soil samples submitted for analyses were placed directly into laboratory provided glassware and stored on ice in a cooler under appropriate chain of custody protocol.

6.1.3 Sample Results

Soil sampling results from the Site Assessment were compared to the following Non-residential SHS MSCs⁸ to help identify potential releases to the environment from the ASTs and their associated piping:

- Non-Res Soil Direct Contact MSCs for soil
- Non-Res Used Aquifer Soil-to-Groundwater MSCs

⁸ As described in Section 5.1.1, soil sampling intervals were based on the results of field screening (i.e., staining, odors, and elevated PID readings). Where potentially impacted materials were not encountered, discrete samples were collected from native soil at a depth of 3.0-3.5 ft bgs, in accordance with PADEP's (2017) *Closure Requirements for Aboveground Storage Tank Systems*. Since only subsurface (>2 ft bgs) soil samples were collected from some locations during the Site Assessment, the comparison of the resulting concentrations to MSCs conservatively disregarded the surface/subsurface soil designation reflected in the Non-residential Soil DC MSCs (i.e., results were compared to the Non-Res DC MSCs for surface soil). This approach was used to evaluate potential releases from tanks within Tank Group 07.

Table 5 identifies the Site Assessment sampling locations where constituents were identified at concentrations greater than the applicable MSCs. Site Assessment results were screened against Non-Residential SHS MSCs, as detailed in the Work Plan. This screening evaluation was conducted to determine if releases could have occurred from the regulated storage tank system being assessed. If concentrations exceeding the MSCs are identified, it is assumed that a release has occurred from the associated storage tank system, and the release was reported to the PADEP.

GP R 494

Two samples (GPR494-01-SS01 and GPR494-08-SS01) collected in proximity to GP R 494 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituents identified are benzo(a)pyrene and lead.

GP R 790

Six samples (GPR790-01-SS01, GPR790-02-SS01, GPR790-03-SS01, GPR790-05-SS01, GPR790-06-SS01, and GPR790-07-SS01) collected in proximity to GP R 790 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is benzene.

GP R 791

Eight samples (GPR791-01-SS01, GPR791-02-SS01, GPR791-03-SS01, GPR791-04-SS01, GPR791-05-SS01, GPR791-06-SS01, GPR791-07-SS01, and GPR791-08-SS01) collected in proximity to GP R 791 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is benzene.

GP R 792

Five samples (GPR792-02-SS01, GPR792-03-SS01, GPR792-04-SS01, GPR792-05-SS01, and GPR792-06-SS01) collected in proximity to GP R 792 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is cumene.

GP R 793

Four samples (GPR793-01-SS01, GPR793-02-SS01, GPR793-03-SS01, and GPR793-04-SS01) collected in proximity to GP R 793 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is cumene.

GP R 794

Seven samples (GPR794-01-SS01, GPR794-02-SS01, GPR794-04-SS01, GPR794-05-SS01, GPR794-06-SS01, GPR794-07-SS01, and GPR794-08-SS01) collected in proximity to GP R 794 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituents identified are benzene, cumene, ethyl benzene, and toluene.

GP R 798

Six samples (GPR798-01-SS01, GPR798-02-SS01, GPR798-04-SS01, GPR798-05-SS01, GPR798-06-SS01, and GPR798-07-SS01) collected in proximity to GP R 798 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is benzene.

GP R 799

Seven samples (GPR799-01-SS01, GPR799-02-SS01, GPR799-03-SS01, GPR799-04-SS01, GPR799-05-SS01, GPR799-06-SS01, and GPR799-07-SS01) collected in proximity to GP R 799 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is benzene.

GP U 767

One sample (GPU767-06-SS01) collected in proximity to GP U 767 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is lead.

GP R 1088

None of the Site Assessment soil samples collected in proximity to GP R 1088 exhibited concentrations greater than the applicable MSCs.

GP R 1116

Two samples (GPR1116-03-SS01 and GPR1116-08-SS01) collected in proximity to GP R 1116 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituents identified are benzene and lead.

GP R 1117

Three samples (GPR1117-05-SS01, GPR1117-06-SS01, and GPR1117-07-SS01) collected in proximity to GP R 1117 and its associated piping exhibited concentrations greater than one or more applicable MSCs. The constituent identified is lead.

Based upon the results, no evidence of a release from GP R 1088 was identified. The Site Assessment outcome for GP R 1088 is “No Obvious Contamination – Sample Results Meet Action Levels”.

Based upon the results of soil samples collected during the Site Assessment and a comparison to generic MSCs, potential releases of regulated substances to the environment from GP R 494, GP R 790, GP R 791, GP R 792, GP R 793, GP R 794, GP R 798, GP R 799, GP U 767, GP R 1116, and GP R 1117 were identified. The Site Assessment outcome category for this AST is “No Obvious Contamination – Sample Results Do Not Meet Action Levels”.

The initial identification of concentrations in soil above applicable MSCs resulted in notifying PADEP of a release to the environment on August 10, 2022. A second notification to PADEP occurred on August 25, 2022; both notifications were made based on Site Assessment soil analytical results. The PADEP assigned the releases in Tank Group 07 to Incident No. 57973. Copies of the notification documents are included in **Appendix H**.

Following the identification of releases in Tank Group 07, PESRM elected to seek closure of the tanks under the SSS. Site Assessment results were subsequently screened against the RBSLs. **Table 6** lists the COPCs (if any) identified in soil at concentrations greater than the RBSLs in the vicinity of each tank in Tank Group 07 during Site Assessment and Site Characterization soil sampling. The spatial distribution of the COPCs identified during the Site Assessment and their concentrations relative to RBSLs are shown

on **Figure 6. Appendix I** provides the soil analytical results from the Site Assessment. Copies of the laboratory reports are included as **Appendix J**.

7 Site Characterization

Based on the results of Site Assessment sampling in Tank Group 07 (Section 6), a Site Characterization plan was developed. The objective of the Site Characterization was to delineate the horizontal and vertical extent of the potential releases until sufficient data were available to determine the need for interim or remedial measures via a site-specific risk assessment.

This section discusses how the Site Characterization plan was developed, the methods used during the sampling, and the evaluation of the results following characterization.

PESRM's Site Characterization plan for Tank Group 07 included the installation of an additional 15 soil borings and the collection of 27 additional soil samples. In addition, the plan included the installation of eight groundwater monitoring wells with two ensuing groundwater sampling events.

7.1 Site Characterization Soil Sampling

The Site Characterization scope for soil included the installation of an additional 15 soil borings and the collection of 27 additional soil samples. Several samples were collected at shallower (e.g., 1-1.5 ft bgs and 1.5-2 ft bgs) and deeper soil intervals (e.g., 2.5-3 ft bgs, 3-3.5 ft bgs, 3.5-4 ft bgs, 4-4.5 ft bgs, and 4.5-5 ft bgs) to vertically characterize the extent of COPC concentrations in soil, as required by 25 PA Code § 245.309(c)(9). The sample collection protocols, and the sampling analyses used during the Site Characterization were consistent with those used during the Site Assessment. The sampling was completed by Terraphase and TPI in conjunction with monitoring well installation activities. The Site Characterization soil sample locations are depicted on **Figure 5b**.

Releases to soil from the ASTs and associated soil contamination would be confined to the secondary containment berms. As a result, the horizontal extent of soil contamination associated with the ASTs is limited to an extent no greater than the berms (except for where piping traverses through the berms). Where space existed between locations of identified soil contamination and the berms, horizontal step out sampling was considered to delineate soil contamination horizontally to within the bermed containment areas.

The Site Assessment sampling methodology included PID field screening of soil during the installation of the soil borings. This allowed the field team to identify the interval with the greatest potential VOC concentrations. If samples were collected at a depth greater than 0-0.5 ft bgs, it was either because PID readings were greater than those observed from 0-0.5 ft bgs, or PID readings indicated no evidence of VOCs and samples were then collected from 3.0-3.5 ft bgs per PADEP (2017). For these situations, shallow soil delineation sampling was unnecessary. Instead, the Site Characterization conservatively assumes that the concentrations observed in these subsurface samples also exist at the surface (i.e., 0-0.5 ft bgs). Samples were collected from the depth corresponding to the highest field screening indication of contamination between the Site Assessment sample depth and the water table. Historical soil sampling results were also used to help support Site Characterization decision-making.

Site Characterization soil sampling was conducted between December 21, 2022 and January 3, 2023.

Appendix G contains copies of the boring logs that describe the soil cores.

7.2 Site Characterization Groundwater Sampling

In addition to soil characterization, eight groundwater monitoring wells (TG07-MW-01, TG07-MW-02, TG07-MW-03, TG07-MW-04, TG07-MW-05, TG07-MW-06, TG07-MW-07, and TG07-MW-08) were installed in the vicinity of tank GP R 494, GP R 1116, GP R 1117, GP R 798, GP R 790, GP R 791, GP R 794, and GP U 767, as depicted in **Figure 5c**. The wells were installed to fully characterize the extent of contamination identified in the vicinity of the tank, as required by 25 PA Code § 245.309(c)(10).

The locations of the monitoring wells were selected with three objectives in mind: (1) to evaluate groundwater in the vicinity of each tank with a reported release, (2) to bias monitoring well locations toward areas where higher concentrations have been detected in soil, and (3) to obtain spatial coverage across the Tank Group.

Terraphase and TPI installed the wells using 4 ½-inch direct push drill casing to 12 feet bgs (TG07-MW-01, TG07-MW-04, TG07-MW-05, TG07-MW-06, TG07-MW-07, and TG07-MW-08) or 13 feet bgs (TG07-MW-02, TG07-MW-03). The monitoring wells were constructed with 10-feet of 2-inch diameter Schedule 40 PVC pre-packed well screens with 0.010-inch slotted screen. A #1 sand filter pack was installed to fill the remaining annular space around the pre-packed screen to 1-foot above the screened interval. A #00 fine sand seal was placed above the pack and the remaining annular space was filled with hydrated bentonite chips. Monitoring well construction logs are provided in **Appendix G**.

During drilling in Tank Group 07, Terraphase identified indications of the potentiometric surface (i.e., saturated soil, standing water in borehole) as shallow as 0.5 ft bgs. The wells were constructed with the minimum amount of vertical riser, to capture the potentiometric surface within the screened interval and while also preventing surface infiltration from entering the monitoring well.

The wells were installed and developed on December 21 and 22, 2022. The well development was conducted by over pumping to remove multiple well volumes with a submersible pump. The submersible pump was surged up and down along the well screen to loosen sediment from the formation into the well. Well development continued until the developed water was clear and free of sediment. Water produced by development of all wells was containerized and treated at the on-site wastewater treatment plant.

Prior to groundwater sample collection, Terraphase collected groundwater level and LNAPL thickness measurements from wells TG07-MW-01, TG07-MW-02, TG07-MW-03, TG07-MW-04, TG07-MW-05, TG07-MW-06, TG07-MW-07, and TG07-MW-08 and existing monitoring wells B-45, B-148 and B-150 using an electronic oil/water interface probe. The results of the gauging are provided in **Table 7**. Groundwater samples were collected from wells TG07-MW-01 through TG07-MW-05, TG07-MW-07, and TG07-MW-08. A LNAPL characterization sample was collected from TG07-MW-06.

Terraphase conducted a groundwater sampling event via low-flow groundwater sampling techniques. Sampling was conducted 2 weeks following well development, on January 4 through 6, 2023. A second round of sampling at these wells is planned for February 2023, the results of which will be presented and evaluated in a forthcoming Site Characterization Report addendum.

The groundwater samples collected from the wells were analyzed for Shortlist 1-6 parameters. The LNAPL characterization sample collected from TG07-MW-06 was analyzed for PIANO VOCs (8260B, VOCs

by GC/MS), PAHs/Biomarkers (8270D-SIM), Organic Lead (8270D-SIM), Density (ASTM D1475), and Saturated Hydrocarbons (8015D by GC-FID).

7.3 Site Characterization Results

Table 8 presents a comparison of the maximum detected COPC soil concentrations across the Site to the applicable RBSLs and reflects both Site Assessment and Site Characterization sampling results. **Table 9** presents the groundwater sample results from the wells sampled during the January 2023 characterization event and compares the concentrations to the RBSLs.

With consideration for soil and groundwater, a comparison to RBSLs indicates the following:

Soil

- Routine Worker Direct Contact Exceedances: benzene, cumene, 1,2,4-TMB, xylenes, B(a)P, and naphthalene
- Construction Worker Direct Contact Exceedances: benzene, cumene, toluene, 1,2,4-TMB, 1,3,5-TMB, xylenes, B(a)P, and naphthalene
- Soil MtGW Exceedances: benzene, cumene, 1,2,4-TMB, xylenes, and naphthalene

Groundwater

- Resident Nonpotable Groundwater Use Exceedances: benzene and toluene
- Construction Worker Direct Contact Exceedances: benzene
- Groundwater Migration-to-Surface Water (MtSW) Exceedances: benzene and cumene

Figure 6 depicts the spatial distribution of the comprehensive soil sampling data (i.e., Historical, Site Assessment, and Site Characterization) that have been generated in Tank Group 07 relative to RBSLs. **Figures 7a through 7h** show the spatial distribution benzene, cumene, toluene, 1,2,4-TMB, 1,3,5-TMB, xylenes, B(a)P, and naphthalene relative to their respective RBSLs in soil. **Figure 8** presents the spatial distribution of Site Characterization groundwater data relative to RBSLs. **Figures 9a through 9c** show the spatial distribution of benzene, cumene, and toluene relative to their respective RBSLs in groundwater.

Appendix I provides the comprehensive soil analytical results from the Site Assessment and Site Characterization. Laboratory reports are provided in **Appendix J**.

7.3.1 Soil Characterization Results

The results of soil sampling have indicated that COPCs have been adequately characterized with respect to the RBSLs. Delineation of COPCs in soil at concentrations above the RBSLs using soil sampling data or tank containment berms is detailed below.

Benzene

As shown on **Table 8**, benzene was detected in soil in the area at a concentration greater than the Routine Worker Direct Contact RBSL (63 milligrams per kilogram [mg/kg]), the Construction Worker

Direct Contact RBSL (8.7 mg/kg), and the Soil MtGW RBSL (98 mg/kg). The concentrations in soil ranged from non-detect to 12,000 mg/kg.

Horizontal delineation of the benzene concentrations exceeding the RBSLs in the vicinity of tanks GP R 798 and GP R 799 is provided by samples collected from borings GPR798-03, GPR799-01, GPR799-08, GPR799-05, GPR798-05, and tank containment berms to the north and west. Vertical delineation of benzene concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

Horizontal delineation of the benzene concentrations exceeding the RBSLs in the vicinity of tanks GP R 790, GP R 791, and GP R 794 is provided by samples collected from borings GPR790-03, GPR791-02, GPR791-09, GPR794-09, GPR794-10, GPR790-08, and tank containment berms to the south, east, and west. Vertical delineation of benzene concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

Horizontal delineation of the benzene concentrations exceeding the RBSLs at boring GPR1116-08 (sampled from 1.5-2.0 ft bgs) is provided by samples collected from borings GPR1116-02, GPR1116-09, GPR1116-11, and GPR1116-01. Vertical delineation of benzene concentrations exceeding the RBSLs is provided by a deeper sample collected at boring GPR1116-08 (sampled from 3.0-3.5 ft bgs).

Figure 7a provides an additional illustration of the spatial distribution of benzene in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

Cumene

As shown on **Table 8**, cumene was detected in soil in the area at a concentration greater than the Routine Worker Direct Contact RBSL (1,000 mg/kg), the Construction Worker Direct Contact RBSL (87 mg/kg), and the Soil MtGW RBSL (1,000 mg/kg). The concentrations in soil ranged from non-detect to 15,000 mg/kg.

Horizontal delineation of the cumene concentrations exceeding the RBSLs in the vicinity of tanks GP R 792, GP R 793, and GP R 794 is provided by samples collected from borings GPR791-09, GPR794-09, GPR794-10, GPR790-08, and tank containment berms to the north, south, east, and west. Vertical delineation of cumene concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

The cumene concentration exceeding the RBSLs in a sample collected from boring GPR799-08 is unrelated to a release from GP R 799 (primary product benzene) or its associated piping. The delineation described above also indicates that the exceedance is unrelated to releases from any other tank system within Tank Group 07. Nonetheless, this exceedance is horizontally delineated by a sample collected from boring GPR799-03 and Evergreen samples collected from borings AOI6-BH-16-026, 1732_1733-01, and AOI6 BH-12-114. Vertical delineation of cumene concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil at this boring.

Figure 7b provides an additional illustration of the spatial distribution of cumene in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

Toluene

As shown on **Table 8**, toluene was detected in soil in the area at a concentration greater than the Construction Worker Direct Contact RBSL (650 mg/kg). The concentrations in soil ranged from non-detect to 6,200 mg/kg.

Horizontal delineation of the toluene concentrations exceeding the RBSL in the vicinity of tank GP R 794 is provided by samples collected from borings GPR790-05, GPR791-04, GPR794-09, GPR794-03, GPR794-07, GPR794-10, and tank containment berms to the south, east, and west. Vertical delineation of toluene concentrations exceeding the RBSL could not be achieved prior to encountering saturated soil in this area.

Figure 7c provides an additional illustration of the spatial distribution of toluene in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

1,2,4-TMB

As shown on **Table 8**, 1,2,4-TMB was detected in soil in the area at a concentration greater than the Routine Worker Direct Contact RBSL (180 mg/kg), the Construction Worker Direct Contact RBSL (70 mg/kg), and the Soil MtGW RBSL (250 mg/kg). The concentrations in soil ranged from non-detect to 330 mg/kg.

Horizontal delineation of the 1,2,4-TMB concentrations exceeding the RBSLs in the vicinity of tank GP R 794 is provided by samples collected from borings GPR792-03, GPR794-02, GPR794-07, GPR794-10, and tank containment berms to the south and west. Vertical delineation of 1,2,4-TMB concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

Figure 7d provides an additional illustration of the spatial distribution of 1,2,4-TMB in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

1,3,5-TMB

As shown on **Table 8**, 1,3,5-TMB was detected in soil in the area at a concentration greater than the Construction Worker Direct Contact RBSL (99 mg/kg). The concentrations in soil ranged from non-detect to 140 mg/kg.

Horizontal delineation of the 1,3,5-TMB concentrations exceeding the RBSL at boring GPR794-08 is provided by samples collected from borings GPR794-04, GPR794-07, GPR794-10, and tank containment berms to the south and west. Vertical delineation of 1,3,5-TMB concentrations exceeding the RBSL could not be achieved prior to encountering saturated soil in this area.

Figure 7e provides an additional illustration of the spatial distribution of 1,3,5-TMB in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

Xylenes

As shown on **Table 8**, xylenes were detected in soil in the area at a concentration greater than the Routine Worker Direct Contact RBSL (240 mg/kg), the Construction Worker Direct Contact RBSL

(51 mg/kg), and the Soil MtGW RBSL (340 mg/kg). The concentrations in soil ranged from non-detect to 560 mg/kg.

Horizontal delineation of the xylenes concentrations exceeding the RBSLs in the vicinity of tank GP R 794 is provided by samples collected from borings GPR791-04, GPR794-09, GPR794-03, GPR794-07, GPR794-10, and tank containment berms to the north, south, east, and west. Vertical delineation of xylenes concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

The xylenes concentration exceeding the RBSLs in a sample collected from boring GPR790-05 is unrelated to a release from GP R 790 (primary product benzene) or its associated piping. The xylenes concentrations identified have been attributed to a release from GP R 794. The description above indicates that the xylenes concentrations exceeding the RBSLs have been delineated.

Figure 7f provides an additional illustration of the spatial distribution of xylenes in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

B(a)P

As shown on **Table 8**, B(a)P was detected in soil in the area at a concentration greater than the Routine Worker Direct Contact RBSL (43 mg/kg) and the Construction Worker Direct Contact RBSL (7.7 mg/kg). The concentrations in soil ranged from non-detect to 54 mg/kg.

Horizontal delineation of the B(a)P concentrations exceeding the RBSLs in the vicinity of tank GP R 494 is provided by samples collected from borings GPR494-03, GPR494-01, GPR494-04, GPR494-06, GPR494-09, GPR494-07 and tank containment berms to the north, south, east, and west. Vertical delineation of B(a)P concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

Figure 7g provides an additional illustration of the spatial distribution of B(a)P in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

Naphthalene

As shown on **Table 8**, naphthalene was detected in soil in the area at a concentration greater than the Routine Worker Direct Contact RBSL (41 mg/kg), the Construction Worker Direct Contact RBSL (6 mg/kg), and the Soil MtGW RBSL (27 mg/kg). The concentrations in soil ranged from non-detect to 52 mg/kg.

Horizontal delineation of the naphthalene concentrations exceeding the RBSLs in the vicinity of tank GP R 794 is provided by samples collected from borings GPR791-04, GPR794-01, GPR794-10, and tank containment berms to the north, south, and west. Vertical delineation of naphthalene concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

The naphthalene concentration exceeding the RBSLs in a sample collected from boring GPR790-05 is unrelated to a release from GP R 790 (primary product benzene) or its associated piping. The naphthalene concentrations identified have been attributed to a release from GP R 794. The description above indicates that the xylenes concentrations exceeding the RBSLs have been delineated.

Horizontal delineation of the naphthalene concentrations exceeding the RBSLs at boring GPR1117-03 is provided by samples collected from borings GPR1117-04, GPR1116-15, GPR1117-02, and the tank containment berm to the north. Vertical delineation of naphthalene concentrations exceeding the RBSLs could not be achieved prior to encountering saturated soil in this area.

Figure 7h provides an additional illustration of the spatial distribution of naphthalene in soil relative to the applicable RBSLs. Tables with the soil analytical results are provided in **Appendix I**.

7.3.2 Groundwater Characterization Results

Terraphase gauged 11 monitoring well locations in the vicinity of Tank Group 07 and measured the depth-to-water and depth-to-product from the top of inner casing. The results of the gauging activities are presented in **Table 7**. LNAPL-corrected depth-to-water measurements and groundwater elevations are also presented in **Table 7**, and the interpreted potentiometric surface is shown in **Figure 10**. The groundwater flow direction in Tank Group 07 is interpreted to be to the west/southwest. Also, during well gauging, measurable LNAPL was confirmed in four of the 11 monitoring wells (B-148, B-150, TG07-MW-06, and TG07-MW-07). The measured LNAPL thicknesses are presented in **Table 7** and **Figure 11**. A LNAPL characterization sample was collected from TG07-MW-06. The minimal LNAPL was purged from well TG07-MW-07 and a groundwater sample was collected low-flow sampling techniques instead.

The results of groundwater sampling have indicated that COPCs have been adequately characterized with respect to the RBSLs. Delineation of COPCs in groundwater at concentrations above the RBSLs using groundwater sampling data is detailed below. Fate and transport analysis of groundwater concentrations is presented in the Risk Assessment (**Appendix C**).

Benzene

As shown on **Table 9**, benzene was detected in groundwater in the area at a concentration greater than the Resident Nonpotable Groundwater Use RBSL (0.30 milligrams per liter [mg/L]), the Construction Worker Direct Contact RBSL (4 mg/L), and the Groundwater MtsW RBSL (130 mg/L). The concentrations in groundwater ranged from non-detect to 240 mg/L.

Local groundwater flow in the vicinity of the GP R 790-series tank area is toward the Schuylkill River to the southwest. Horizontal delineation of the benzene concentrations exceeding the RBSLs in the downgradient direction is provided by the groundwater sample collected from TG07-MW-08 and groundwater samples collected by Evergreen from wells B-172 and B-157. The monitoring wells are shown on **Figure 9a** and provide an illustration of the spatial distribution of benzene in groundwater relative to the applicable RBSLs. Tables with the groundwater analytical results are provided in **Appendix I**.

Cumene

As shown on **Table 9**, cumene was detected in groundwater in the area at a concentration greater than the Groundwater MtsW RBSL (2.6 mg/L). The concentrations in groundwater ranged from 0.00034 mg/L to 7.2 mg/L.

Local groundwater flow in the vicinity of the GP R 790-series tank area and GP U 767 is toward the Schuylkill River to the southwest. Horizontal delineation of the cumene concentrations exceeding the

RBSL in the downgradient direction is provided by groundwater samples collected by Evergreen from wells B-172, B-156, B-176, and B-157.

The monitoring wells are shown on **Figure 9b** and provide an illustration of the spatial distribution of cumene in groundwater relative to the applicable RBSLs. Tables with the groundwater analytical results are provided in **Appendix I**.

Toluene

As shown on **Table 9**, toluene was detected in groundwater in the area at a concentration greater than the Resident Nonpotable Groundwater Use RBSL (25 mg/L). The concentrations in groundwater ranged from non-detect to 0.58 mg/L to 27 mg/L.

Local groundwater flow in the vicinity of the GP R 790-series tank area is toward the Schuylkill River to the southwest. Horizontal delineation of the toluene concentrations exceeding the RBSLs in the downgradient direction is provided by the groundwater sample collected from TG07-MW-08 and groundwater samples collected by Evergreen from wells B-172, B-156, and B-157. The monitoring wells are shown on **Figure 9c** and provide an illustration of the spatial distribution of benzene in groundwater relative to the applicable RBSLs. Tables with the groundwater analytical results are provided in **Appendix I**.

LNAPL Characterization Results

On December 4, 2023, a LNAPL characterization sample was collected from TG07-MW-06. The results of the LNAPL sampling are currently pending.

Horizontal delineation of LNAPL in the vicinity of the GP R 790-series tanks is provided by wells TG07-MW-04, TG07-MW-02, B-163, B-145, B-126, B-157, B-155, and B-154.

7.3.3 Vapor Intrusion

At this time, because there is no current vapor intrusion exposure in this area, and because future assessment will be conducted and exposure pathways will be mitigated as necessary, vapor intrusion exposure in the Tank Group 07 area is not a current or reasonably expected future exposure scenario and it was not considered in determining the need for additional Site Characterization sampling. However, Site Assessment and Site Characterization data were evaluated for potential future vapor intrusion exposure scenarios as part of the risk assessment in Section 8.

7.4 Data Quality Assurance, Quality Control, and Usability

While the Site Assessment and Characterization sampling data were not subject to formal data validation, elements were included to help assess data quality and usability of the results to support the project objectives. This included the collection of quality assurance/quality control samples, general quality control checks on the field and laboratory information, and an assessment of the impact of elevated reporting limits due to sample-specific interferences.

7.4.1 Quality Assurance/Quality Control Samples

During the Site Assessment/Characterization field activities, one trip blank sample per sample cooler and approximately 1 field blank per 10 soil samples was submitted to the analytical laboratory to evaluate potential cross-contamination during sample container shipment and storage. Results of the quality assurance and quality control sample analyses are provided in **Appendix I**. COPCs were not detected in blank samples at concentrations greater than the laboratory reporting limits. As such, there is no concern associated with laboratory cross-contamination and/or sampling-related cross-contamination for samples collected from the Site.

Approximately one field duplicate sample per every 20 soil samples was also collected to evaluate the variance in the sampling/analysis. Relative percent differences (RPDs) for duplicate pairs were calculated and ranged from 0 to 199 percent with an average of 89 percent. Overall, RPDs <50 percent generally represent the typical level of variability. Reasons for a higher RPDs can include sample heterogeneity or samples with high concentrations. Given that the predominant soil type sampled is anthropogenic fill some additional variability is expected and reasonable.

7.4.2 General Quality Control Checks

General quality control checks were also performed on the field information and laboratory analytical deliverables. This included checking and reviewing laboratory logins and completed chains of custody, confirming that the requested analyte lists were reported, and that the sample nomenclature conformed to the proposed sampling scope of work. In some cases, multiple analyses were reported by the laboratory and a general review of elements such as surrogate recoveries, qualifiers, analytical limits, and laboratory narratives were performed to identify which results would be used for a given sample. A log of these general checks is provided in **Appendix I** along with the methodology used to select between multiple results when provided by the analytical laboratory.

8 Risk Assessment

The site-specific risk assessment report (**Appendix C**) was prepared to document the methodology and results of a site-specific human health risk assessment performed in accordance with 25 Pa. Code § 250.409, to support a demonstration that conditions at the Site meet the tank closure performance standard in accordance with the Storage Tank and Spill Prevention Act (Act 32).

Based on the review of the soil and groundwater concentrations in comparison to the RBSLs and the spatial distribution of concentrations greater than these levels, the soil and groundwater sampling performed adequately defines the horizontal and vertical extent of COPCs to support a site-specific risk assessment.

Using soil and groundwater data collected in accordance with the Work Plan and *Site Characterization Sampling and Analysis Plan – Tank Group 07* submitted to PADEP on December 5, 2022, and the methodologies as described in Section 5 of the Risk Assessment, cumulative cancer risk and noncancer HI estimates for the exposure of current and reasonably expected future receptor populations (summarized in **Table 4 of the Risk Assessment**) to COPCs in soil and groundwater were calculated.

As discussed in Section 5.3 of the Risk Assessment, the Risk Assessment identifies potentially unacceptable risk/HI to routine workers (via vapor intrusion) and construction workers (via direct contact) from exposure to COCs in soil in the area of Tank Group 07. It also identifies potentially unacceptable risk/HI to routine workers (via vapor intrusion), maintenance workers (via direct contact), and construction workers (via direct contact) from exposure to COCs in groundwater in the area of Tank Group 07.

The following discusses these results by environmental media and locations on the Site that would warrant consideration for risk management action.

8.1 Soil

As presented on **Table 7 of the Risk Assessment**, locations with soil COPC concentrations that could result in cumulative cancer risk and/or HI estimates for potential routine workers via vapor intrusion from soil that are above the risk management goals include GPR1116-07, GPR1117-03, GPR790-01, GPR790-02, GPR790-05, GPR791-01, GPR791-03, GPR791-04, GPR791-06, GPR792-01, GPR792-02, GPR792-03, GPR792-04, GPR792-05, GPR792-06, GPR792-07, GPR793-01, GPR793-02, GPR793-03, GPR793-04, GPR793-05, GPR793-06, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-07, GPR794-08, GPR798-04, and GPR799-08 (**Figure 12**). These unacceptable cancer risk and/or HI estimates are predominately driven by benzene, cumene, toluene, 1,2,4-TMB, 1,3,5-TMB, xylenes (total), and naphthalene.

As presented on **Table 7 of the Risk Assessment**, locations with soil COPC concentrations that could result in HI estimates above the risk management goal for potential construction workers via soil direct contact soil include GPR790-01, GPR790-05, GPR791-01, GPR791-04, GPR792-01, GPR792-02, GPR792-03, GPR792-04, GPR792-05, GPR792-06, GPR793-01, GPR793-02, GPR793-03, GPR793-04, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-08, and GPR798-04. These unacceptable HI

estimates are predominately driven by benzene, cumene, toluene, 1,2,4-TMB, xylenes (total), B(a)P, and naphthalene.

8.2 Groundwater

As presented on **Table 9 of the Risk Assessment**, locations with groundwater COPC concentrations that could result in cumulative cancer risk and/or HI estimates above the risk management goals for potential routine workers via vapor intrusion from groundwater, maintenance worker groundwater direct contact, and construction worker groundwater direct contact include TG07-MW-07, B-149, B-150, B-154, B-155, B-177, and B-179 (**Figure 13**). These unacceptable cancer risk and/or HI estimates are predominately driven by benzene.

8.3 Conclusion

Exposure of routine workers to COCs via soil vapor intrusion and of construction workers to COCs via soil direct contact may warrant risk management action. Exposure of routine workers to COCs via groundwater vapor intrusion and of maintenance and construction workers to COCs via groundwater direct contact may warrant risk management. All other exposure scenarios do not warrant risk management.

As discussed in Section 7.3.3, potentially unacceptable vapor intrusion exposures will be managed separately following additional characterization/evaluation and eventually through pathway elimination, and therefore, no further risk management action for this exposure pathway is proposed. To facilitate remedial action planning for all other exposure pathways, SSS for each of the COCs were developed. These SSS, if achieved in the Tank Group 07 area, would achieve acceptable risk/HI for each receptor exposure scenario under current and reasonably expected future land/groundwater use. The development of the SSS is further detailed in Section 6 of the Risk Assessment.

The overall SSS that would achieve an acceptable risk/HI for receptor exposure to soil in the area are as follows:

- Benzene: 130 mg/kg
- Cumene: 680 mg/kg
- Toluene: 1,200 mg/kg
- 1,2,4-TMB: 36 mg/kg
- Xylenes (total): 110 mg/kg
- B(a)P: 3.9 mg/kg
- Naphthalene: 4.4 mg/kg

The overall SSS that would achieve an acceptable risk/HI for groundwater is:

- Benzene: 11 mg/L

9 Ecological Screening Evaluation

The following describes the ecological screening evaluation that was performed for the Site. This evaluation was conducted in accordance with 25 PA Code § 250.311, as specified in 25 PA Code § 245.310(28). The regulatory framework for conducting an ecological screening evaluation under the Site-Specific Standard is outlined in Section III.I and summarized in the Ecological Screening Flow Chart provided in Figure III-11 of PADEP’s Land Recycling Program Technical Guidance Manual (2021). Under the Site-Specific standard, PADEP generally follows the USEPA Ecological Risk Assessment Guidance for Superfund (USEPA 1997). The USEPA ecological risk assessment process is comprised of eight steps.

The Initial Screening phase of the process consists of Steps 1 and 2, as follows:

- Step 1: Fundamental Components (Screening-level Problem Formulation and Ecological Effects Evaluation).
- Step 2: Preliminary Exposure Estimate and Risk Assessment.

As indicated on Figure III-11 the Technical Guidance Manual, after completion of the Initial Screen (Steps 1 and 2), the qualified investigator decides whether there exists substantial risk of ecological harm to species or habitats of concern. If not, then, no further ecological evaluation would be warranted.

Under Step 1 of the Initial Screen, a preliminary evaluation is performed to determine whether there is potential for impact on species or habitats of concern. In order to evaluate this, Terraphase first conducted an assessment to determine whether species or habitats of concern are present at the site. If species or habitats of concern are not identified, the completion of Step 2 and any subsequent steps in the ecological risk assessment process are not warranted. The evaluation of whether species or habitats of concern are present at the site consisted of the following:

- A search of PADEP’s Pennsylvania Natural Diversity Inventory (PNDI) database.
- Site reconnaissance.

The PNDI search was performed for the Site and also a conservative study area that consisted of the Site and areas within a 2,500 foot radius of the site. The results of the PNDI search for the Site indicated no threatened and endangered species and/or special concern species and resources are present. The results of the PNDI search for the study area indicated that further review by the PA Game Commission, The PA Department of Conservation and Natural Resources (DCNR), and the PA Fish and Boat Commission was warranted. Accordingly, Terraphase submitted a request for further review to the three entities. Based on further review by the PA Game Commission, DCNR, and PA Fish and Boat Commission, no potential impacts to species or habitats of concern were identified within the study area. The results of the PNDI searches and subsequent correspondence with the PA Fish and Boat Commission are provided as **Appendix K**.

Because species or habitats of concern were not identified, the completion of Step 2 and any subsequent steps in the ecological risk assessment process are not warranted. As such, no further ecological screening is required.

10 Summary and Conclusions

Terraphase has prepared this Report, on behalf of PESRM, to detail the results of the Site Assessment and Site Characterization activities and to provide the supporting information demonstrating that adequate characterization has been performed for a reliable determination of the need for remedial action based on the selected standard.

The Site Assessment and Site Characterization activities described in this Report were performed in accordance with the applicable provisions of Act 32, 25 PA Code Chapter 245 (Subchapter D), and Terraphase’s Work Plan (2021). The specific ASTs addressed in this Report include:

- GP R 1117 (PADEP No. 005A)
- GP R 791 (PADEP No. 006A)
- GP R 798 (PADEP No. 007A)
- GP R 494 (PADEP No. 029A)
- GP R 1116 (PADEP No. 030A)
- GP R 1088 (PADEP No. 033A)
- GP R 790 (PADEP No. 034A)
- GP R 792 (PADEP No. 035A)
- GP R 793 (PADEP No. 036A)
- GP R 794 (PADEP No. 037A)
- GP R 799 (PADEP No. 039A)
- GP U 767 (PADEP No. 046A)

Visual observations of the ASTs in Tank Group 07 revealed no indications of release. Based upon the results, no evidence of a release from GP R 1088 was identified. The Site Assessment outcome for GP R 1088 is “No Obvious Contamination – Sample Results Meet Action Levels”.

Based upon the results of soil samples collected during the Site Assessment and a comparison to generic MSCs, potential releases of regulated substances to the environment from GP R 494, GP R 790, GP R 791, GP R 792, GP R 793, GP R 794, GP R 798, GP R 799, GP U 767, GP R 1116, and GP R 1117 were identified. The Site Assessment outcome category for these ASTs is “No Obvious Contamination – Sample Results Do Not Meet Action Levels”. Notifications of release were submitted to the PADEP on August 10, 2022 and August 25, 2022. PADEP assigned the releases in Tank Group 07 to Incident No. 57973. The notifications indicated that unknown amounts of petroleum-related substances were potentially released in Tank Group 07 from these ASTs.

Site Characterization soil and groundwater sampling were subsequently performed in Tank Group 07. The results of the investigations identified soil and groundwater COPCs at concentrations greater than site-specific RBSLs. The results of the sampling have indicated that COPCs have been adequately characterized with respect to the RBSLs.

The potential significance of COPC concentrations were evaluated via a site-specific risk assessment. The risk assessment demonstrates that exposure of routine workers to COCs via soil vapor intrusion and of construction workers to COCs via soil direct contact may warrant risk management action. Exposure of routine workers to COCs via groundwater vapor intrusion and of maintenance and construction workers to COCs via groundwater direct contact may warrant risk management. All other exposure scenarios do not warrant risk management.

As discussed in Section 7.3.3, potentially unacceptable vapor intrusion exposures will be managed separately following additional characterization/evaluation and eventually through pathway elimination, and therefore, no further risk management action for this exposure pathway is proposed. To facilitate remedial action planning for all other exposure pathways, SSS for each of the COCs were developed. These SSS, if achieved in the Tank Group 07 area, would achieve acceptable risk/HI for each receptor exposure scenario under current and reasonably expected future land/groundwater use. The development of the SSS is further detailed in Section 6 of the Risk Assessment.

The overall SSS that would achieve an acceptable risk/HI for receptor exposure to soil in the area are as follows:

- Benzene: 130 mg/kg
- Cumene: 680 mg/kg
- Toluene: 1,200 mg/kg
- 1,2,4-TMB: 36 mg/kg
- Xylenes (total): 110 mg/kg
- B(a)P: 3.9 mg/kg
- Naphthalene: 4.4 mg/kg

The overall SSS that would achieve an acceptable risk/HI for groundwater is:

- Benzene: 11 mg/L

Upon approval of this Site Characterization Report, PESRM will prepare and submit a Remedial Action Plan (RAP) for Tank Group 07. As described in Section 4, soil and groundwater in and around Tank Group 07 has been impacted by historical releases to the environment. PESRM is aware that Evergreen is in the process of conducting remediation pilot tests in the area west of tanks 790-799. PESRM plans to coordinate with Evergreen regarding responsibility for any necessary actions to address unacceptable risks to receptors in this area of the Facility. The forthcoming RAP will describe whether PESRM or Evergreen will be responsible for ongoing and future risk management actions in Tank Group 07.

Abbreviations:

Chem Group - chemical group

INORG - metals

SVOC - semi-volatile organic compounds

VOC - volatile organic compounds

MtGW - migration to groundwater

MtSW - migration to surface water

NV - not volatile

WIT - without inhalation toxicity data

NA - not applicable: target groundwater concentration times DAF is greater than constituent's solubility.

IE - inadequate exposure

NSW - no surface water quality criteria available

Notes:

Only constituents detected are shown.

The concentrations for the Xylene isomers (m/p and o) were summed before comparing to the criteria for Xylenes (total).

Ratios of concentration to the RBSLs greater than 1 are shaded in bold.

Chem Group - chemical group; INORG - metals; PFAS - Per- and Polyfluoroalkyl Substances; SVOC - semi-volatile organic compounds; VOC - volatile organic compounds; PFAS - Per- and Polyfluoroalkyl Substances

Notes:
 Only chemicals detected in the area are shown.
 The concentrations for the Xylene isomers (m/p and o) were summed before comparing to the criteria for Xylenes (total).
 Ratios of concentration to the RBSLs greater than 1 are shaded in bold.
 Chem Group - chemical group; INORG - metals; SVOC - semi-volatile organic compounds; VOC - volatile organic compounds; PFAS - Per- and Polyfluoroalkyl Substances
 Meas Basis - measured basis; T = total, D = dissolved

File: N:\GIS\PT\P044_001_PESRM-PES\MapDocs\AST\Work\Tank_Group_07\GW_Contours\20230130\Figure 8 - TG07 Groundwater Contours.mxd 2/1/2023 Created by: Mia Coordinate System: NAD 1983 StatePlane Pennsylvania South FIPS 3702 Feet

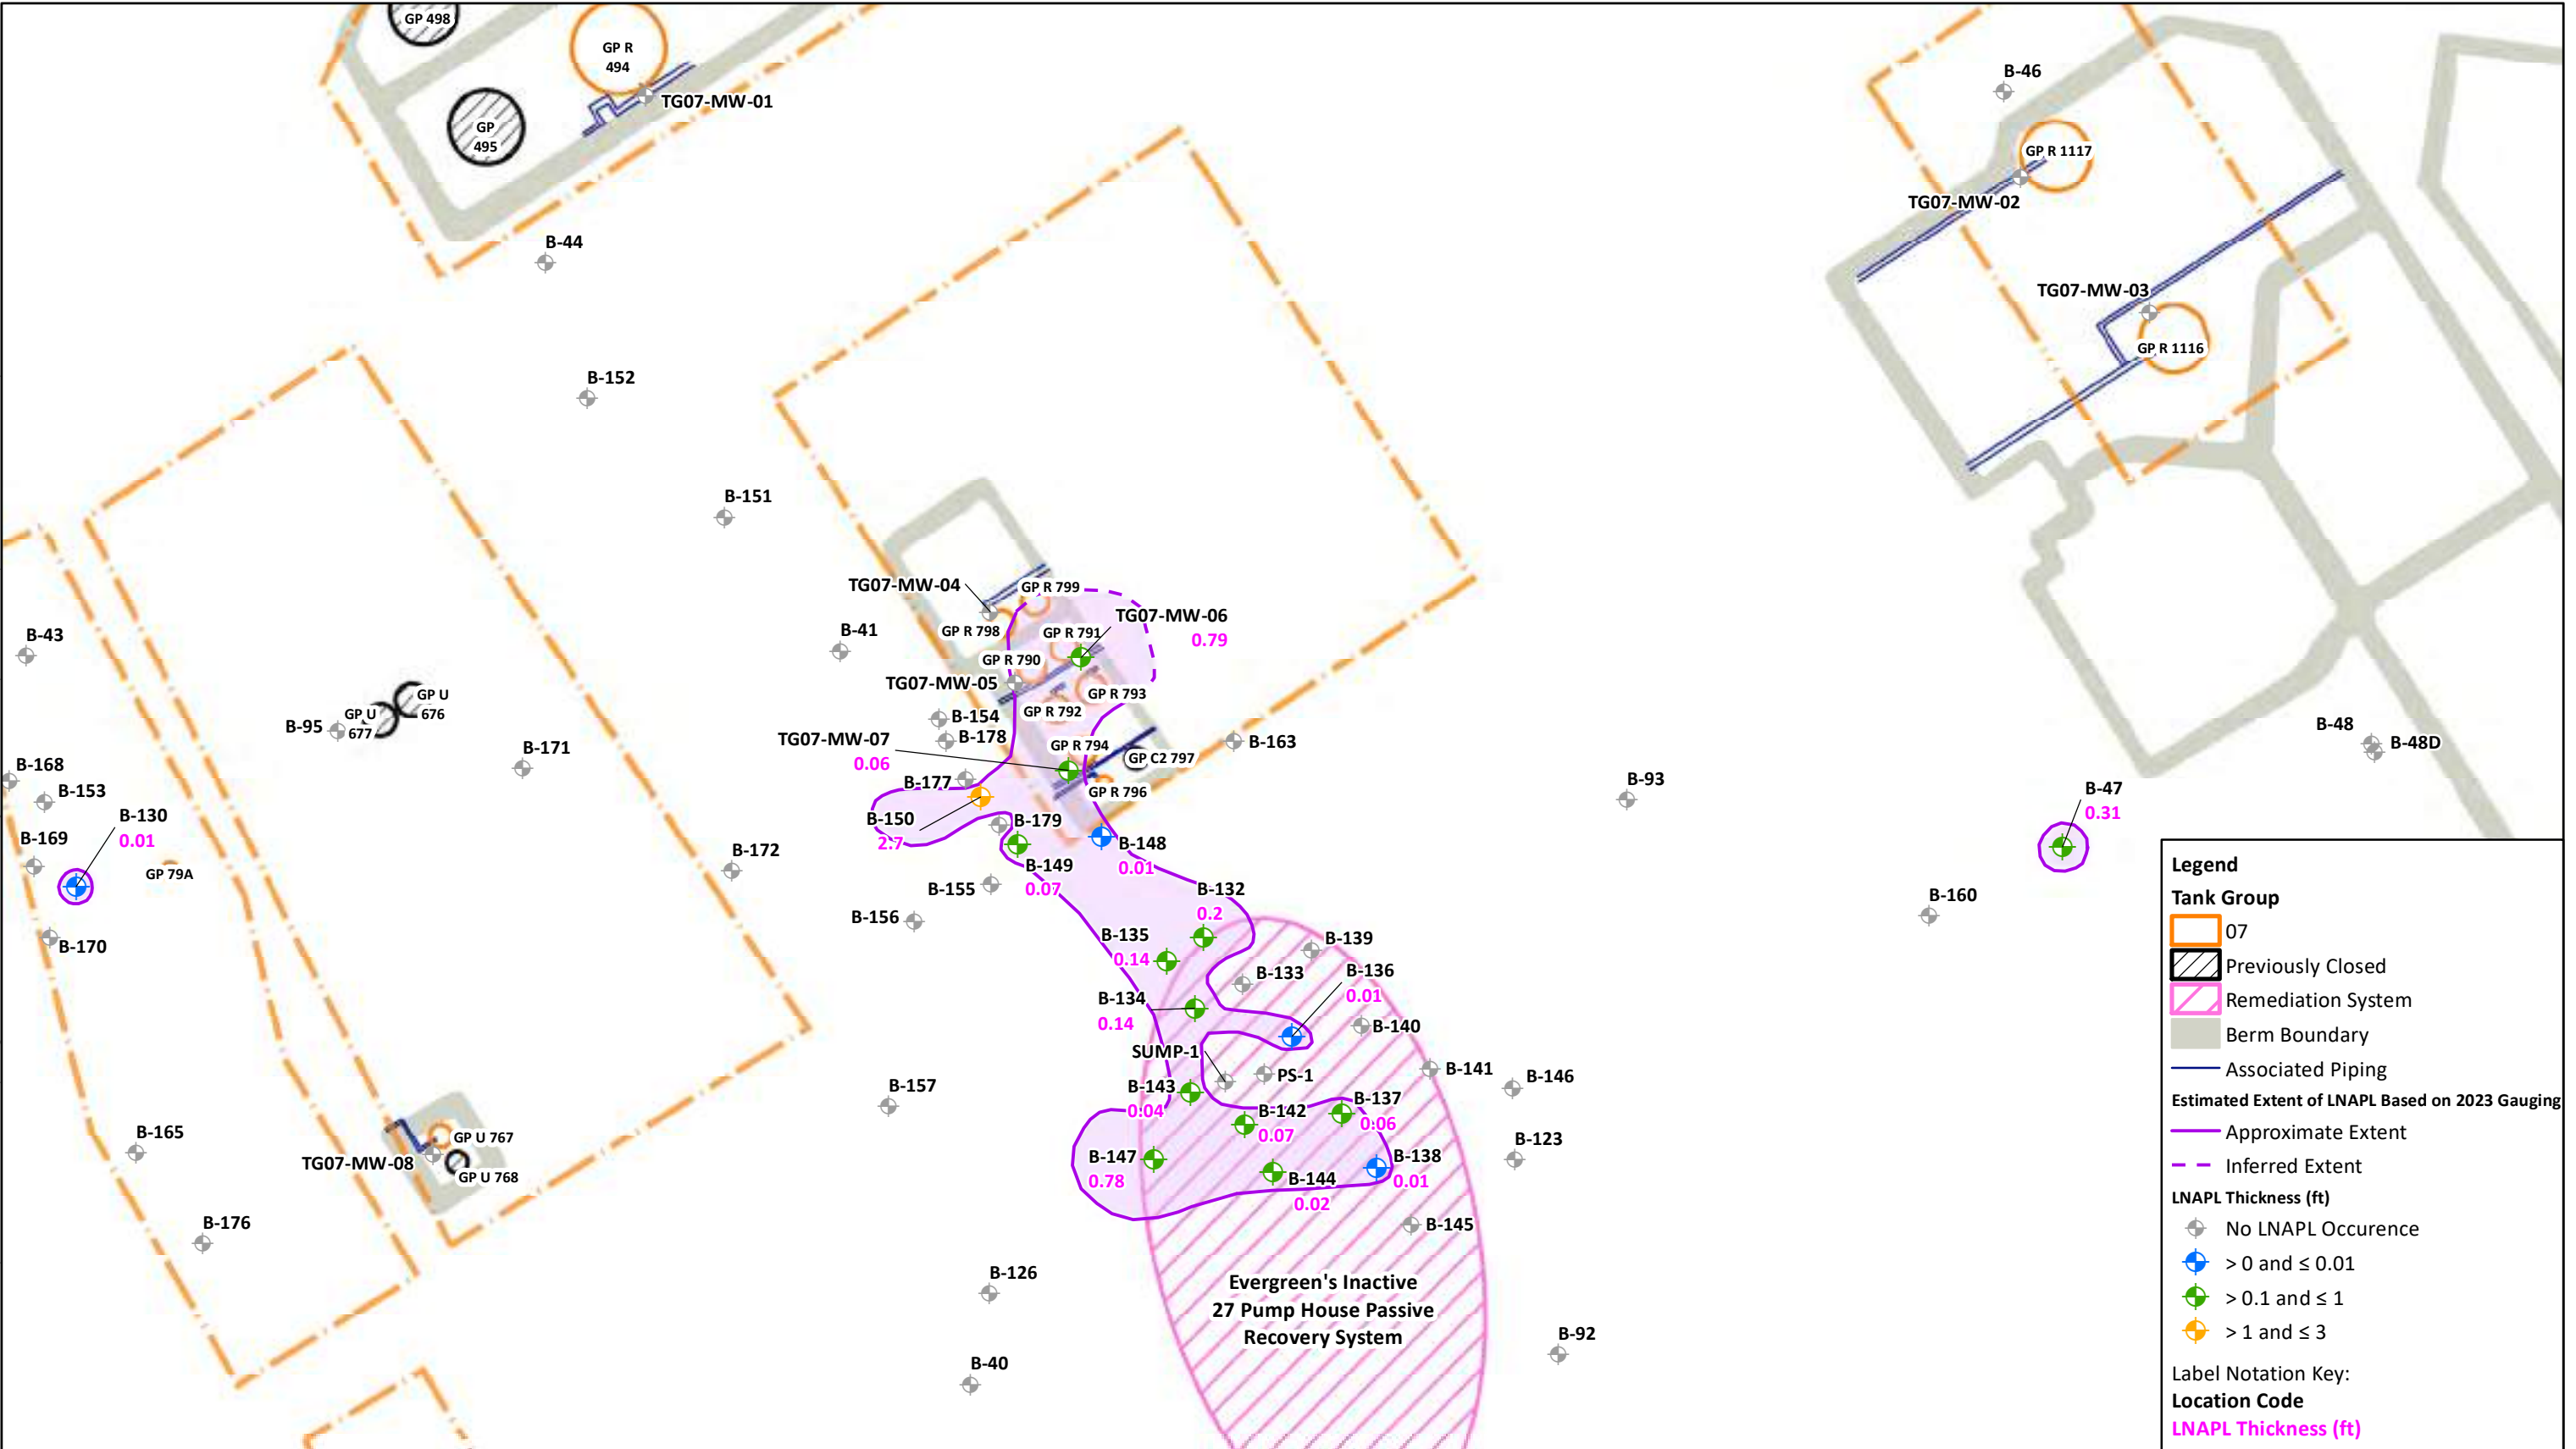

Note:
 1. Groundwater elevation contour interval is 1.0 feet.
 2. Corrected Depth to Water Levels factor an average LNAPL density of 0.82, where present.
 3. Monitoring well B-148 was not included in groundwater contour maps provided in the AOI 6 RIR (GHD 2017) presumably due to its anomalously low groundwater elevation. PESRM has likewise not included well B-148 in the groundwater contours presented in this figure.

Figure No. **FIGURE 2**

SOURCE: PHILADELPHIA REFINERY REMEDIATION PROGRAM GROUNDWATER REMEDIATION STATUS REPORT, FIRST HALF 2016, STANTEC, 2016.

GENERALIZED LITHOLOGY GRAPHICS

	Fill		Sand (incl. trace to little silt/clay/gravel)		Mud
	Sandy Gravel		Muddy Sand		Bedrock (incl. saprolite where indicated)
	Gravelly Sand		Sand with Lignite		

Notes:

1. Land surface profile obtained from a 2010 light detection and ranging (LIDAR) elevation model available from the United States Geological Survey (USGS).
2. Lithologic logs for borings PH-55, PH-41, B-11, B-7, B-4, B-1 and PH-30 were obtained from Tables 13 and 14 of Greenman et al., 1991. Geographic locations for those historic borings were estimated by Stantec in a GIS using a georeferenced image of Plate 1 of that report. Fill thickness interpreted by Stantec.
3. PH-25 terminal boring depth deeper than shown.
4. Water depths for the Schuylkill River were estimated using soundings provided on the National Oceanic and Atmospheric Administration (NOAA) navigation chart for the Delaware River, Philadelphia and Camden Waterfronts (Chart 12313). Mean lower low water (MLLW) depths were transformed to the North American Vertical Datum of 1988 (NAVD 88).
5. Stantec generalized lithologic data from available borehole logs into 8 categories as indicated for interpretive purposes.
6. Correlation between lithologies and, where applicable, geologic units is based on the straight-line method. Actual conditions between boreholes may vary from what is shown on this profile. Contacts dashed where inferred.
7. Vertical Exaggeration - 45 X

1 Introduction

Terraphase Engineering Inc. (Terraphase), on behalf of Philadelphia Energy Solutions Refining and Marketing LLC (PESRM), has prepared this *Site-Specific Human Health Risk Assessment* (the Risk Assessment) in support of the *Site Characterization Report* (Report) for Tank Group 07 (the Site), located within the Former Philadelphia Energy Solutions refinery facility (the Facility). This document describes the methodology and results of a site-specific human health risk assessment, performed in accordance with 25 Pa. Code § 250.409, to support a demonstration that conditions at the Site meet the tank closure requirements in accordance with the Storage Tank and Spill Prevention Act (Act 32).

The Facility, which is located at 3144 West Passyunk Avenue, Philadelphia, Pennsylvania (**Figure 1**), is undergoing tank closure activities in preparation for redevelopment. Tank Group 07 is located within an area of the Facility referred to as the Girard Point Refinery (Girard Point) (**Figure 2**). As discussed in Terraphase's (2021) *Aboveground Storage Tank Closure Work Plan* (Work Plan), which was approved by the Pennsylvania Department of Environmental Protection (PADEP) on April 23, 2021, closure of the above ground storage tanks (ASTs) under Act 32 is being pursued through a group closure process, in which ASTs in the same general area (e.g., tank farm) are demolished, removed, investigated, and evaluated at about the same time. There are eight tank groups in all and demolition of the tanks has been proceeding in phases at the Facility from the north to the south.

Following the demolition of the ASTs in Tank Group 07, between July 2022 and January 2023, soil and groundwater (including light non-aqueous phase liquid [LNAPL]) sampling was conducted in accordance with the Work Plan and the *Site Characterization Sampling and Analysis Plan – Tank Group 07* (SAP) submitted to PADEP on December 7, 2022. The sampling was performed to gather the data necessary to assess whether conditions at the Site following closure activities are protective of human health and the environment.

This Risk Assessment has been completed in accordance with the Pennsylvania Land Recycling and Environmental Remediation Standards Act (Act 2) and risk assessment guidance from PADEP and the United States Environmental Protection Agency (USEPA). It is organized as follows:

- Section 2 presents the site setting. Information regarding the site description, operational history and usage of the tanks, topography, geology, and hydrology of the area is summarized. A discussion of on-site and off-site land and groundwater use under current and reasonably expected future land and groundwater use is also provided.
- Section 3 discusses the results of the soil, groundwater, and LNAPL¹ sampling performed in accordance with the Work Plan and SAP. This section documents how the sampling results adequately characterize the nature and extent of constituents in the environment to select a remediation standard and perform a site-specific risk assessment.

¹ At the time this Risk Assessment was completed, LNAPL characterization data had not been received. Therefore, wells with LNAPL are conservatively assumed to present an unacceptable risk to current and reasonably expected future receptors. An addendum will be provided to PADEP upon receipt and evaluation of the forthcoming LNAPL characterization data.

- Section 4 discusses the preparation of data used in the risk calculations.
- Section 5 presents the human health risk assessment calculations and the resulting risk characterization.
- Section 6 provides the site-specific standards proposed to support remedial action planning in the area.
- Section 7 summarizes the results of the human health risk assessment and the site-specific standards developed to support remedial action.
- Section 8 provides the references used in the preparation of this report.

Supporting information for the Risk Assessment is provided in **Appendix A**. **Appendix B** provides a discussion regarding how risk-based screening levels were derived to support investigation decisions during the Site Characterization and to demonstrate adequate characterization to support the Risk Assessment. **Appendix C** provides the analytical results from the soil and groundwater sampling performed. Finally, **Appendix D** provides select figures from the *Remedial Investigation Report, AOI 6* (AOI 6 RIR; GHD 2017) and the *Sitewide Fate and Transport Remedial Investigation Report* (Sitewide Fate and Transport RIR, Stantec 2022).

2 Site Setting

This section presents the site setting and includes a description of the Site, the local climate, topography, geology, and hydrology, and the on-site and off-site land and groundwater use.

2.1 Site Description

The Facility, a former 1,300-acre refinery, is currently undergoing decommissioning to support redevelopment. The Site² is 20.6 acres³ in size and is located within Girard Point, an area that is also referred to as AOI 6 by Evergreen as part of their One Cleanup Program effort. The Site is located north of the Platt Bridge, between Lanier Street and the Schuylkill River. Prior to demolition, Tank Group 07 consisted of six separate areas containing tanks located in the central portion of Girard Point. The areas are separated by buildings, large piping structures, and plant access roadways. Except for the asphalt roadways and parking areas that pass through the portions of Tank Group 07, and the tank foundations themselves, the area is not covered by hardscape.

The ASTs addressed in this Report are listed in **Table 1 of the Report**. Nine other ASTs, not subject to this closure effort, were previously located within Tank Group 07.

Figure 3 provides a layout of Tank Group 07.

² Tank Group 07 consists of a tank farm referred to by the Facility as the North Tank Farm.

³ This is the area of Tank Group 07, excluding the 07A area, which will be evaluated separately.

2.2 Operational History/Usage of the Tanks

The Facility operated as a petroleum refinery between 1860 and 2019. The refinery ceased operations in 2019. The demolition and decommissioning of the subject ASTs began in September 2021. Prior to demolition, the primary products held within these tanks were: Benzene (GP R 790, GP R 791, GP R 798, and GP R 799), fresh caustic (GP R 1088), cumene (GP R 792 and GP R 793), distillate, main frac bottoms (GP R 494), recovered oil (GP U 767), tetraethylene glycol (GP R 794), and UDEX feed (GP R 1116 and GP R 1117). Additional details regarding the size, contents, and construction of the tanks are provided in **Table 1 of the Report**.

2.3 Topography

Topography at the Site is generally flat except for containment berms constructed around the tank areas to provide containment in the event of a release. Regional topography slopes gently to the west towards the Schuylkill River, the nearest water body to the Site. The ground surface elevation at the Site is approximately 7 feet (ft) above mean sea level⁴.

2.4 Regional Geology and Hydrogeology

The Facility is located within the Atlantic Coastal Plain Physiographic Province of Pennsylvania. The Atlantic Coastal Plain is a physiographic province that is defined as having a flat topography, underlain by unconsolidated sediments that thicken to the southeast. The Coastal Plain deposits are sand, gravel, silt, and clay which drape over crystalline igneous and metamorphic rocks. In general, the resulting sediments are approximately 250 ft thick along the Delaware River. These sediments unconformably overlie much older, very complexly deformed rocks of the Piedmont physiographic province. The Coastal Plain deposits in the vicinity of the Facility consist of anthropogenic fill underlain by quaternary deposits.

Much of the Facility and surrounding area is underlain by historical fill material, which was placed for the purpose of reclaiming lowlands along the banks of the tidal Delaware and Schuylkill Rivers during industrialization. Below the fill material, sediments consist of gray, muddy deposits with occasional sand, gravel, and organic-rich lenses. These sediments were deposited in floodplain, channel, and marsh environments through the Holocene. The most recent deposits are poorly consolidated and below the phreatic surface of the unconfined aquifer, as a result of their relatively young geologic age and position along the Schuylkill River (tributaries and creeks). Below the Holocene deposits is a Pleistocene glacial outwash deposit, commonly referred to as the "Trenton Gravel" along the Delaware River valley. Cretaceous-age sand and clay units making up the Potomac-Raritan-Magothy aquifer system underly the Pleistocene deposits.

The sedimentary record near the Site consists of a complex series of water-bearing sand units which can comprise one or more hydrostatic units. Historical investigations conducted at the Facility have identified two saturated zones, including an unconfined shallow groundwater unit (occurring within the Holocene and Trenton Gravel deposits) and a deep groundwater unit known as the Farrington Sand,

⁴ North American Vertical Datum of 1988.

which is part of the Potomac-Raritan-Magothy aquifer system. The deeper groundwater unit is separated by a clay unit; as such, the deeper groundwater has been classified as a semi-confined aquifer. Groundwater is first encountered generally at the Facility at a depth approximately 0.5 to 6 ft below ground surface (bgs) (GHD 2017). **Appendix D** provides select figures from the *Remedial Investigation Report, AOI 66* (AOI 6 RIR; GHD 2017) and the *Sitewide Fate and Transport Remedial Investigation Report* (Sitewide Fate and Transport RIR, Stantec 2022) for reference including, Figure 8 from the AOI 6 RIR which provides a detailed cross section of the subsurface in this area.

2.5 Local Geology and Hydrogeology

During the Site Assessment and Site Characterization, soil at the Site was primarily investigated within the upper 5 ft, although Site Characterization monitoring wells were advanced to a maximum depth of 13 ft. Anthropogenic fill up to 5 ft thick was observed in soil cores collected from most of the soil borings installed in Tank Group 07. Soil beneath the fill layer generally consists of brown to gray sand, clay, and silt.

Historically, unconfined aquifer groundwater has been first encountered in Tank Group 07 at a depth of approximately 0.5 to 6 ft bgs (GHD 2017). During Site Characterization activities, groundwater was encountered between approximately 0.5 and 6 ft bgs.

Groundwater at Girard Point has historically been interpreted to flow toward the Schuylkill River. Based on Figure 14 of the AOI 6 RIR (GHD 2017) and Figure 3-29 of the Sitewide Fate and Transport RIR (Stantec 2022) included in **Appendix D**, unconfined aquifer groundwater flow within Tank Group 07 appears to be southwest.

2.6 On-site and Off-site Land Use

This section describes on-site and off-site land use under current and reasonably expected future conditions. As shown on **Figure 2**, the Site is located between approximately 30-ft and 3,300-ft from the Facility property boundary and almost 3,600-ft (2/3 mile) from the nearest residential area. While the following sections include a discussion of off-facility land and groundwater use, for the purposes of this Risk Assessment, on-site is considered to be the Site and off-site is considered to be the area surrounding the Site but still within the Facility's property boundary.

2.6.1 Current

Currently, the Site and its immediate surrounding area is undergoing decommissioning/demolition work, environmental investigation, and predevelopment activities. The land is zoned for Industrial Use.⁵ Aside from the asphalt roadways that pass through portions of Tank Group 07, and the tank foundations themselves, the area is currently uncovered and lightly vegetated. The Site is generally flat except for containment berms constructed around the tank areas to provide containment in the event of a release.

⁵ <https://openmaps.phila.gov/>.

The area surrounding the Facility is currently characterized by a mixture of residential, commercial, and industrial properties.⁶

2.6.2 Future

As captured in the conceptual imagery developed by Hilco Redevelopment Partners⁷, the area encompassing Tank Group 07 is being redeveloped into a state-of-the-art, multimodal industrial park and life sciences campus with ancillary rail infrastructure, energy infrastructure, marine capabilities, and commercial uses. As a result, reasonably expected future land use in the area of the Site is commercial/industrial. Also, following redevelopment, much of the area is expected to be covered by hardscape (e.g., building pads, drive aisles, parking lots, roadways) or other features that will generally function as barriers to direct contact exposure.

In the future, land use in proximity to the Facility is expected to remain a mixture of residential, commercial, and industrial properties (City of Philadelphia 2022).

2.7 Groundwater Use

Stemming from several efforts to assess the potential for current and reasonably expected future use of groundwater at and in the vicinity of the Facility, Evergreen has documented no confirmed drinking water supply wells within 1-mile of the Facility. These efforts have included several well searches, field verification, and a review of the City of Philadelphia's ordinances. In 2021, Evergreen supplemented these efforts by reviewing the City of Philadelphia's publicly available information concerning potable drinking water intakes, contacting PADEP's Safe Drinking Water Program, contacting the City of Philadelphia's Health Department, contacting the City of Philadelphia Water Department, contacting the City of Philadelphia Department of Parks and Recreation, conducting updated database searches (paGWIS and eMapPA), coordinating with the PADEP to obtain information from the New Jersey Department of Environmental Protection, and providing additional documentation concerning the institutional controls at the Site which prohibit groundwater use (Evergreen 2021).

Overall, with consideration for the information compiled by Evergreen regarding groundwater use, this Risk Assessment assumes the following:

- Groundwater on-site, off-site, and on-facility is not a current or reasonably expected future source of potable or nonpotable water.
- Groundwater off-facility is not a current or reasonably expected source of potable water or nonpotable water.
- Groundwater off-facility is assumed to be a reasonably expected future source of nonpotable water.

3 Site Characterization

This section discusses the results of the soil and groundwater sampling and LNAPL gauging performed in accordance with the Work Plan and SAP. A review of these results and how they adequately characterize the nature and extent of constituents in soil and groundwater at the Site, in support of the site-specific risk assessment, is also provided.

3.1 Soil Investigation

As discussed in the Work Plan, when no evidence of a release to the environment was identified during Tank Group 07 AST removal, ASTs were subject to Site Assessment sampling using a grid-based approach with additional biased samples toward the locations of pipe connections or other key infrastructure. Sampling was conducted during multiple mobilizations as the tanks were being demolished and the ground became available for sampling. The first mobilization was on July 18, 2022, and the last mobilization was completed on October 21, 2022, after the removal of double bottoms.

In total, 95 soil borings were installed and 108 soil samples were collected during the Site Assessment. **Figures 4A through 4D** show the location of each of the Site Assessment soil borings.

Based on the results of Site Assessment sampling in Tank Group 07, a Site Characterization plan was developed (Terraphase 2022). The objective of the Site Characterization was to delineate the horizontal and vertical extent of the potential releases until sufficient data were available to determine the need for interim or remedial measures. Site Characterization soil sampling was conducted between December 21, 2022, and January 3, 2023. The Site Characterization scope included the installation of an additional 15 soil borings and the collection of an additional 27 soil samples.

Each soil sample was analyzed for the constituents of potential concern (COPCs) listed in **Table 1** by Alpha Analytical, Inc. of Westborough, Massachusetts, or Eurofins of Edison, New Jersey, both of which are PADEP-certified laboratories.

Further details are provided in Sections 5 and 6 of the Report.

3.2 Adequacy of Characterization

In accordance with 25 Pa Code § 245.309(b), the site characterization “shall provide sufficient physical data, through field investigations, to determine the regulated substances involved, and the extent of migration of those regulated substances in surface water, groundwater, soil or sediment.” Per the *Technical Guidance Manual* (PADEP 2021), in order to support a site-specific risk assessment “the investigation needs to sufficiently characterize the nature and extent and composition of the regulated substances that have been released.”

Per these requirements, the soil and groundwater sampling data collected were reviewed to determine whether additional soil sampling would be warranted to complete site characterization and a site-

specific risk assessment.⁸ To help support this evaluation, site-specific risk-based screening levels (RBSLs) were derived in accordance with PADEP and USEPA risk assessment guidance. The RBSLs help to segregate soil and groundwater sampling data that indicate a higher potential for health significance from those that indicate a low potential. The RBSLs and their derivation are summarized in **Appendix B**. The soil and groundwater sampling results were compared to the RBSLs and the spatial distribution of concentrations greater than these levels is presented on **Figures 4 and 5**. The identification of locations with constituent concentrations greater than these RBSLs does not necessarily mean that an unacceptable risk has been identified. It simply helps a reviewer focus on a subset of the data in order to make decisions regarding whether additional field investigation is necessary to support a risk assessment. The key consideration during this evaluation is whether constituents identified at concentrations above the RBSLs have sufficient lateral and vertical characterization to ensure that reliable and conservative estimates of the exposure concentration (usually a 95 percent upper confidence limit (UCL) on the mean) for a particular exposure area (and exposure scenario) can be developed. Based on these considerations, the soil and groundwater sample results at the Site were evaluated to determine the adequacy of the data to support the site-specific risk assessment.

3.2.1 Soil

As shown in **Table 2**, 19 of the 23 analyzed constituents were detected in soil at the Site. Benzene, cumene, ethyl benzene, toluene, 1,2,4-trimethylbenzene (124-TMB), 1,3,5-trimethylbenzene (135-TMB), xylenes (total), benzo(a)pyrene (BaP), and naphthalene were detected in soil at concentrations greater than the RBSLs. Benzene, cumene, 124-TMB, xylenes (total), BaP, and naphthalene were detected in soil at concentrations greater than the routine worker direct contact RBSLs. Benzene, cumene, ethyl benzene, toluene, 124-TMB, 135-TMB, xylenes (total), and naphthalene were detected in soil at concentrations greater than the routine worker vapor intrusion RBSLs. Benzene, cumene, toluene, 124-TMB, 135-TMB, xylenes (total), BaP, and naphthalene were detected in soil at concentrations greater than the construction worker direct contact RBSLs. Benzene, cumene, 124-TMB, xylenes (total), and naphthalene were detected in soil at concentrations greater than the soil migration to groundwater RBSLs. Cumene exceeds the soil migration-to-groundwater screening level for groundwater migration-to-surface water.

As further described in Section 7 of the Report, based on the review of the soil concentrations in comparison to the RBSLs and the spatial distribution of concentrations greater than these levels, the soil sampling performed adequately characterizes the nature and extent of regulated substances to support a site-specific risk assessment. The horizontal and vertical extent of constituents identified at concentrations above the RBSLs has been determined such that reliable and conservative estimates of the exposure concentration for the exposure area can be developed.

⁸ LNAPL samples were also collected for analysis. However, receipt of analytical results is still pending.

3.2.2 Groundwater

As shown on **Table 3**, 20 of the 22 analyzed constituents were detected in groundwater. Benzene, cumene, toluene, xylenes (total), and naphthalene were detected in groundwater at concentrations greater than the RBSLs. Benzene and toluene were detected in groundwater at concentrations greater than the nonpotable groundwater use RBSLs. No constituents were detected in groundwater at concentrations greater than the routine worker volatilization to outdoor air RBSLs. Benzene was detected in groundwater at concentrations greater than the routine worker vapor intrusion and construction worker direct contact RBSLs. Benzene and cumene were detected in groundwater at concentrations greater than the groundwater migration to surface water RBSLs.

As further described in Section 7 of the Report, based on the review of the groundwater concentrations in comparison to the RBSLs (considering the most recent groundwater sampling results from each of the wells installed and sampled by Evergreen) and the spatial distribution of concentrations greater than these levels, the groundwater wells provide results that adequately characterize the nature and extent of regulated substances to support a site-specific risk assessment. The horizontal extent of constituents identified at concentrations above the RBSLs has been determined such that reliable and conservative estimates of the exposure concentration for the exposure area can be developed.

4 Data Selection and Preparation

All soil and groundwater data collected during the investigation are considered in this Risk Assessment. The most recent groundwater sampling results from each of the wells installed and sampled by Evergreen in the area of Tank Group 07 were also considered. The following procedures are used to prepare the sampling data to support quantitative risk assessment. These procedures, which account for USEPA risk assessment guidance (USEPA 1989), are as follows:

- Constituent concentrations qualified by the lab as not detected (i.e., U-qualified) are evaluated as non-detects in accordance with USEPA guidance (1989)⁹.
- Constituent concentrations qualified by the lab as estimated (i.e., J-qualified) are included and treated as detected concentrations for quantitative assessment.
- The concentrations of xylenes are the sums of the concentrations of the isomers that were detected and half the quantitation limits of the isomers that were not detected in the same sample but were

⁹ As described in Section 4, any constituent detected in soil or groundwater is considered a COPC in the Risk Assessment. Also, as discussed in Section 5.1.2, in accordance with USEPA (1989) guidance, for each COPC the maximum detected concentrations in soil and groundwater are initially used as exposure concentrations for each exposure scenario. For some COPCs, the risk estimates were refined to reflect conservative estimates of the mean COPC concentration across the exposure area and reflected data from some locations where COPC were non-detect. These estimates of the mean were calculated using USEPA's (2015) ProUCL software which includes methods for estimating upper confidence limits on the mean for left-censored datasets.

detected in the same matrix at the Site. If no isomer was detected in a sample, the constituent is considered to be not detected in the sample and handled accordingly, as described in Section 5.1.2.

- Constituent concentrations in duplicate field samples are averaged to obtain a representative concentration for the sample. When a constituent was detected in only one sample of a duplicate pair, the average of the detected concentration and one-half the quantitation limit for the non-detect is used.

While PADEP's (2021) *Technical Guidance Manual* and USEPA's (1989) risk assessment guidance include an optional step for shortening the list of constituents included in quantitative assessments, this risk assessment does not eliminate any detected constituents from the cumulative risk calculations. For this Risk Assessment, any constituent detected in soil or groundwater at the Site is considered a COPC, regardless of if the constituent exceeded the RBSL or not.

5 Human Health Risk Assessment

Terraphase has performed this risk assessment to evaluate potential human health risks that could be attributable to former releases of hazardous constituents at the Site (i.e., Tank Group 07). Potential risks are characterized using a reasonable maximum exposure (RME), or a conservative estimate of the RME under the current and reasonably expected future land uses at and around the Site. The methods used in the human health risk assessment are based upon PADEP and USEPA human health risk assessment guidance.

Section 5.1 describes how the exposure assessment is performed including the identification of scenarios for potential human exposure, the compilation of exposure factors for each receptor, and how exposure concentrations are calculated. Section 5.2 describes how toxicity values are compiled. Section 5.3 discusses how the risk characterization is performed and Section 5.4 summarizes the impact of currently anticipated uncertainties on the outcome of the risk characterization.

5.1 Exposure Assessment

In accordance with 25 Pa Code § 250.602(c)(2), this section discusses the exposure assessment performed to evaluate risks associated with potential human exposures to COPCs in soil and groundwater at the Site. It discusses the exposure assumptions used to quantify potential exposure via the incidental ingestion and inhalation exposure routes. Please note that while 25 Pa Code § 250.602(c)(2) indicates that an exposure assessment shall consider "ingestion, inhalation, and volatilization" pathways, this risk assessment also includes an evaluation of dermal contact in the exposure assessment.

The potential exposures via ingestion and dermal contact are quantified in terms of a dose as follows:

$$Dose = Concentration \times Intake$$

The dose for evaluating cancer risk is averaged over a lifetime and is called the lifetime average daily dose. For evaluating noncancer effects, the dose is averaged over the duration of potential exposure

and is called the average daily dose. The concentration term in the dose equation refers to the average constituent concentration in an environmental medium to which a population is exposed over a specified duration. The intake term refers to the intake rate of the contaminated environmental medium, which is a function of the magnitude, frequency, and duration of exposure. The methods for estimating the concentration term are discussed in Sections 5.1.2 and 5.1.3. The exposure factors used to quantify the magnitude, frequency, and duration of potential exposures are discussed in Section 5.1.4.

Inhalation exposures are quantified in terms of an exposure concentration, which is an air concentration that is time-weighted over the duration of exposure. The exposure concentration for evaluating cancer risk is an average over a lifetime. For evaluating chronic and subchronic noncancer effects, the exposure concentration is an average over the duration of exposure. The methods for estimating air concentrations are discussed in Sections 5.1.2 and 5.1.3.

The environmental setting at and around the Site, including climate, geology, hydrogeology, water supply, land and groundwater use, is discussed in the Report and Section 2, and therefore is not repeated in this section.

5.1.1 Scenarios for Potential Human Exposure

Per the requirements specified in 25 Pa Code § 250.602 and § 250.603, this section identifies potentially exposed populations (receptors) and describes the exposure pathways for each receptor. The receptors and exposure pathways are also summarized in **Table 3**.

Current Conditions

The Site is currently undergoing decommissioning/demolition work, environmental investigation, and predevelopment activities. Access to the Facility is controlled with fencing and site security. Because of this, trespassing at the Site is expected to be extremely limited under current conditions. The current on-site receptors evaluated in the human health risk assessment include construction workers who may become exposed during site redevelopment or major construction activities and trespassers. Workers who occasionally perform site investigation work on-site are not evaluated because they are required to follow health and safety procedures, including the use of appropriate personal protective equipment, to prevent unacceptable exposures. Workers involved with the redevelopment and reuse of the Site are evaluated in the risk assessment, assuming they do not follow health and safety procedures or wear personal protective equipment.

Future Conditions

Reasonably anticipated future receptors at and in the immediate vicinity of the Site could include workers who may be exposed during the performance of typical or routine commercial activities (routine workers), maintenance workers who may become exposed during maintenance activities including minor subsurface repair/utility activities, construction workers who may become exposed during site redevelopment or major construction activities, and trespassers.

Potential exposure of routine workers is assumed to include incidental ingestion and dermal contact with COPCs in exposed surface soil. Routine workers could also be exposed to the following:

- COPCs in vapors and particulates from exposed surface soil
- COPCs in vapors from subsurface soil shallow groundwater that migrates into outdoor air
- COPCs in vapors from subsurface soil and groundwater that migrates through building foundations into indoor air

Potential future exposure of construction workers and maintenance workers is assumed to include the following:

- Incidental ingestion and dermal contact with COPCs in exposed surface and subsurface soil and shallow groundwater
- Inhalation of COPCs in airborne particulates and vapors from exposed surface and subsurface soil and shallow groundwater

Potential future exposures of trespassers¹⁰ are assumed to include the following:

- Incidental ingestion of and dermal contact with COPCs in exposed surface soil
- COPCs in vapors and particulates from exposed surface soil
- COPCs in vapors from subsurface soil and shallow groundwater that migrates into outdoor air

Overall, the risk assessment quantitatively evaluates potential exposure of on-site and off-site receptor populations under current (construction workers, trespassers) and future (routine workers, maintenance workers, construction workers, trespassers) conditions. As discussed in Section 2 and as shown on Figure 2, the Site is located between 30-ft and 3,300-ft from the Facility property boundary and approximately 3,600-ft (2/3 mile) from the nearest residential area. For the purposes of this Risk Assessment, on-site is considered to be the Site and off-site is considered to be the area surrounding the Site but still within the Facility's property boundary. The risk assessment does consider and evaluate the potential for groundwater contamination to migrate to the Schuylkill River given its proximity to the Site.

5.1.2 Exposure Concentrations

This section describes how exposure concentrations are determined for the soil and groundwater risk estimates.

5.1.2.1 Soil Exposure Concentrations

To evaluate potential exposure to soil and to streamline this risk assessment, initially the maximum detected concentration of each COPC in soil from any location across the Site and at any depth is conservatively used as the exposure concentration for each exposure scenario. This initial set of soil

¹⁰ While receptor populations could include trespassers, this risk assessment did not quantitatively evaluate the potential exposure of these receptors, but instead relies upon the quantitative risk calculations performed for routine workers to serve as a surrogate for this population.

concentrations represents upper-bound estimates of the actual exposure concentrations, and as such, the cumulative cancer risk and noncancer hazard index (HI) estimates calculated using these concentrations represent upper-bound estimates.

If an upper-bound RME cumulative cancer or noncancer HI estimate for an exposure unit exceeds the PADEP risk management goals (i.e., incremental cumulative cancer risk greater than 1×10^{-4} and/or noncancer HI greater than 1)¹¹, then a less high-biased estimate of the RME risk/HI is calculated only for those constituents contributing most to the upper-bound cumulative risk/HI estimates using more representative (refined) exposure concentrations. For the remaining COPCs, maximum detected concentrations are retained as the exposure concentrations.

For evaluating direct contact with soil,¹² refined exposure concentrations are estimated by calculating a 95 percent UCL on the mean using the soil data from sampling locations within the exposure area, which conservatively includes the entire Tank Group 07 area. The UCLs are calculated using the maximum detected concentrations from any depth at each sample location. The UCL calculations are performed using ProUCL (Version 5.1.00 [USEPA 2015]), including the Kaplan-Meier method for datasets with non-detects¹³. For expediency, the recommended values from ProUCL are used. The UCLs are then used to estimate the cumulative cancer risk and HI for the exposure area. Where such refinements are made, the specific refinement for each case and rationale is discussed in Section 5.3.2. This approach (i.e., refining the exposure concentrations for only the COPCs contributing most to the cumulative risk/HI) is efficient since it avoids calculations (such as UCL calculations) that would not materially affect the cumulative cancer risk and/or HI estimates and is consistent with USEPA guidance (1989). This approach is also conservative, because it uses the maximum detected concentration, rather than 95 percent UCLs, for many COPCs.

¹¹ Per PADEP's request, cumulative cancer risks and noncancer HIs greater than 1.0×10^{-4} and 1.0 respectively, have also been identified as potentially warranting risk management. While this approach has been used in support of this project, it is Terraphase's position that USEPA's risk assessment and risk management guidance, as well as PA's regulations and guidance indicate that rounding risk estimates to one significant figure is appropriate. Presenting risk characterization results with one significant figure is standard practice, and we are not aware of any scientific basis that would justify presenting the risk characterization results with more than one significant figure. As USEPA (2004) noted, doing so would imply a level of precision that cannot be justified.

¹² Direct contact exposure to soil includes incidental ingestion, dermal contact, and inhalation of particulates from exposed surface soil and vapors from surface and subsurface soil into outdoor air.

¹³ For such left-censored data sets with non-detect results consisting of multiple detection limits (DLs) or reporting limits (RLs), ProUCL includes several methods for estimating upper confidence limits on the mean including methods which use Kaplan Meier (KM) (1985) estimates. Based upon Kaplan Meier estimates, and the distribution and skewness of detected observations, several upper limit computation methods which adjust for data skewness are incorporated in ProUCL 5.1. The KM estimation method is based upon a distribution function estimate, like the sample distribution function, except that the KM method adjusts for censoring. The KM method is commonly used in survival analysis (e.g., dealing with right-censored data associated with terminally ill patients) and various other biomedical applications. Section 4 of USEPA's (2015) *ProUCL Version 5.1.002 Technical Guide* includes a detailed discussion regarding how ProUCL calculates upper confidence limits on the mean for data sets containing non-detect observations, including using the KM estimation method (Section 4.4).

As a supplement to these exposure area risk/HI estimates, for exposure scenarios where potentially unacceptable risks/HIs are identified and for vapor intrusion exposure, soil risk/HI estimates are calculated for each soil sampling location. This is done to facilitate the identification of areas with potentially unacceptable risks/HI and to guide risk management decision making (e.g., what areas of the Site would warrant and not warrant vapor intrusion risk management). For these location-specific calculations, the highest detected concentration of each COPC from any depth at each soil sample location is used. Additionally, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, ½ the analytical limit is used. This set of soil concentrations represent upper-bound estimates of the actual exposure concentrations, and as such, the cumulative cancer risk and noncancer HI estimates calculated using these concentrations should also be considered upper-bound estimates.

5.1.2.2 Groundwater Exposure Concentrations

To evaluate potential exposure to groundwater and streamline this risk assessment, initially the maximum detected concentration of each COPC in groundwater from any location across the Site is conservatively used as the exposure concentration for each exposure scenario. As a supplement to these exposure area risk estimates, for exposure scenarios where potentially unacceptable risk/HI estimates are identified, groundwater risk/HI estimates are calculated for each well. This is done to facilitate the identification of areas of the Site with potentially unacceptable risk/HI and to guide risk management decision making. For these location-specific calculations, the highest detected concentration for each COPC is used. Where a COPC is non-detect at a location but detected within the media at the Site, ½ the analytical limit is used.

5.1.3 Fate and Transport Models

The following models are used in the risk assessment to estimate exposure concentrations for the exposure scenarios discussed in Section 5.1.1. These models are used by USEPA and state regulatory agencies (including PADEP) for conservative, screening level analysis. The following are brief descriptions of the models. Further details of these models are provided in **Appendix A**.

5.1.3.1 Vapor Emission from Exposed Soil

Vapor emissions from exposed soil are estimated using the Jury model (Jury et al. 1938) based on depletion over time, assuming conservatively that the soil is initially impacted from the ground surface to the water table (a depth of approximately 3 ft bgs, the average depth to groundwater in Tank Group 07).

A discussion of the model is provided in **Appendix A**.

5.1.3.2 Vapor Emission from Groundwater

Vapor emissions from groundwater (not exposed) are calculated using the steady-state diffusion equation in one-dimension assuming a constant source concentration and a maximum concentration gradient.

A discussion of the model is provided in **Appendix A**.

5.1.3.3 Vapor Emission from Exposed Groundwater

The model for estimating vapor emissions from exposed groundwater during excavation activities is estimated using mass transfer coefficients recommended by USEPA (1995).

A discussion of the model is provided in **Appendix A**.

5.1.3.4 Air Dispersion

Annual average air concentrations are estimated using the empirical correlations presented in USEPA's (2002) *Supplemental Guidance for Developing Soil Screening Levels for Superfund Sites*, assuming a square source area, and correlation coefficients for the Philadelphia, Pennsylvania meteorological area, which is the area nearest to the Site among the locations with available correlation coefficients.

For soil and groundwater exposures, the source area is assumed to be 20.6 acres, the area of Tank Group 07. For exposure scenarios where groundwater is encountered during excavations to the water table, the air concentrations are estimated in an analogous manner, but the source area is based on a 15 by 15-foot excavation area and an averaging period of 24 hours. The maximum 24-hour average air concentration was estimated from the annual average air concentration by using a conservative factor of 0.4/0.19 (or 2.1 [USEPA 2002]).

5.1.3.5 Dust Emission

For the routine worker exposure scenario that involves exposure to COPCs in outdoor soil, the emission of respirable soil particulates (PM₁₀) is calculated using the wind erosion model recommended by USEPA (1996b) with USEPA default soil parameters, and wind speed and anemometer height from the nearest weather station, which is located in Philadelphia, Pennsylvania (NOAA 2018).

During maintenance activities, the PM₁₀ level is set at 50 micrograms per cubic meter (µg/m³). This PM₁₀ level is based on a time-weighted average assuming maintenance workers spend 1/3 of their exposure period excavating into the subsurface and 2/3 of their exposure period conducting maintenance activities that do not involve excavation into the subsurface. In calculating the time-weighted average, the 24-hour average National Ambient Air Quality Standards for PM₁₀ of 150 µg/m³ is used as the PM₁₀ concentration during excavations and a PM₁₀ concentration of 1 µg/m³ is used for the time during maintenance activities that do not involve excavation. The PM₁₀ concentration during non-excavation maintenance activities is expected to be less than 1 µg/m³, based on the wind erosion model recommended by USEPA (1996b) using site-specific wind speed from Philadelphia, Pennsylvania (NOAA 2018).

During construction activities, the PM₁₀ level is set at 50 µg/m³, which is the former annual average National Ambient Air Quality Standard for PM₁₀ since construction workers are assumed to be performing excavations for a work year. It is assumed that the PM₁₀ concentration would be at this limit every day for the entire period of construction worker exposure.

5.1.3.6 Vapor Intrusion into Future Buildings

Indoor air concentrations from the migration of vapors from soil and groundwater into a hypothetical future nonresidential building is estimated using the model described by Johnson and Ettinger (1991), which PADEP and USEPA recommend for screening level evaluations (PADEP 2021; USEPA 2004a, 2017b). Indoor air concentrations from groundwater into a hypothetical future nonresidential building are also estimated using this model.

Indoor air concentrations from the migration of vapors from on-site soil is calculated by assuming that soil contamination extends from the bottom of the future building slab to the water table (i.e., a depth of 3 ft) for all constituents. These calculations also assume that the building cracks are filled with sand and utilize generic properties for sand recommended by USEPA (2004a).

A discussion of the model and the input parameters used in the assessment is provided in **Appendix A**.

5.1.3.7 Nonpotable Groundwater Use

Potential exposures to COPCs in groundwater via nonpotable groundwater use are evaluated using a hypothetical scenario where groundwater is used to fill a backyard wading pool (“kiddie” pool). This scenario represents a reasonable worst case exposure scenario in which the estimated exposure is expected to be higher than those associated with other nonpotable uses (e.g., watering lawns, washing cars). The model for estimating vapor emission from a residential kiddie pool is based on models for estimating vapor emissions from open-top batch tanks (USEPA 1995a, 1995b).

A discussion of the model and the input parameters used in the assessment is provided in **Appendix A**.

5.1.3.8 Soil-to-Groundwater Pathway

Impacts to groundwater from site-related constituents are evaluated by calculating cancer risk and noncancer HI estimates by scaling off of the risk-based soil migration-to-groundwater RBSLs. These RBSLs were calculated using both an “equilibrium partitioning” (also called soil/water partitioning [USEPA 1996a]) and a “leach test” methodology, as described in **Appendix B**. For each COPC, the soil screening level corresponding to the more realistic of the two calculation methods is used as a soil migration-to-groundwater screening level. Soil migration-to-groundwater RBSLs were calculated using the target groundwater concentrations based on groundwater RBSLs for the following scenarios:

- Routine worker exposure to COPCs in groundwater via volatilization to outdoor air and vapor intrusion
- Construction worker exposure to COPCs in groundwater via direct contact
- Receptor exposure to COPCs in groundwater via nonpotable groundwater use

Because the groundwater migration to surface water screening levels are not entirely human health based, estimates of cancer risk and HI are not calculated to evaluate this exposure scenario. Instead, soil concentrations that could result in exceedances of the groundwater migration to surface water RBSLs are identified.

The target groundwater concentrations are presented in **Appendix B, Attachment 4**.

5.1.3.9 Groundwater Contaminant Transport

Where potentially unacceptable risk/HI via exposure to groundwater has been identified in Site Characterization samples collected from groundwater monitoring wells installed to characterize current concentration(s) in the vicinity of soil sources that could be related to releases from the ASTs, a 2-dimensional fate and transport model was used to calculate the maximum potential future downgradient extent of the unacceptable risk/HI. The PADEP's spreadsheet application of the analytical model developed by P.A. Domenico (Quick Domenico; QD) was used to conduct the evaluation which PADEP recommends be used for screening level evaluations.

The results of the QD modeling are depicted in **Figure 7** and **Appendix A, Attachment 8**.

5.1.4 Exposure Factors

In this risk assessment, standard default exposure factors¹⁴ recommended by PADEP and USEPA for estimating RME are used where available and appropriate. Where standard default exposure factors are not available or appropriate for an exposure scenario, the evaluation was conducted using exposure factors that are based on site-specific considerations and professional judgment. The standard default exposure factors are conservative assumptions about the magnitude, frequency, and duration of exposures, which, in combination, are intended to provide estimates of exposures that are higher than actual exposures to a large portion (90 to 99 percent) of a potentially exposed population.

5.1.4.1 Routine Workers

In this risk assessment, potential exposure of routine workers to constituents in soil and groundwater is conservatively evaluated using the standard default exposure factors used by PADEP in deriving the Statewide Health Standards. Where PADEP has not recommended a standard default exposure factor, standard default exposure factors recommended by USEPA (1991, 2014) are used where available and appropriate.

Soil Ingestion Rate

The soil ingestion rate of 50 milligrams per day (mg/day) is PADEP's default value for evaluating RME in nonresidential settings (25 Pa Code § 250.306(d)).

Soil Dermal Contact Rate and Absorption

The dermal contact rate is the product of the exposed skin surface area and the soil-to-skin adherence factor. The exposed skin surface area of 3,527 square centimeters per day (cm²/day) and the soil-to-skin adherence factor of 0.12 milligrams per square centimeter (mg/cm²) are USEPA's recommended values for evaluating RME with soil by workers in commercial/industrial settings (USEPA 2014). The absorbed dose from dermal contact with soil is estimated by multiplying the dermal contact rate by USEPA-recommended absorption factors for absorption from soil (USEPA 2004b).

¹⁴ Because PADEP does not maintain default exposure factors for dermal contact with soil, this exposure assessment used standard default dermal contact exposure factors recommended by USEPA for evaluating RME (USEPA 2014).

Exposure Time

Routine workers are assumed to be at the Site with the potential to inhale vapors and particulates from site-related sources for 8 hours/day. This exposure time is PADEP's (25 Pa Code § 250.307(d)) and USEPA's recommended value for full-time workers (USEPA 2009).

Exposure Frequency

An exposure frequency of 180 days/year is used to evaluate outdoor nonresidential exposure to soil. It is also used to evaluate nonresidential exposure to vapors in outdoor air from shallow groundwater. This is PADEP's standard default value for evaluating nonresidential exposures, which assumes frozen ground for several days of the year consistent with 25 Pa Code § 250.307(d).

An exposure frequency of 250 days/year is used to evaluate indoor nonresidential exposure to constituents from soil and shallow groundwater via vapor intrusion. This assumption is USEPA's standard default value for evaluating RME in commercial/industrial settings (USEPA 1991, 2014). It is based on a 5-day work week and 50 weeks/year.

Exposure Duration

The exposure duration of 25 years is the PADEP (25 Pa Code § 250.307(d)) and USEPA (1991, 2014) standard value for estimating RME in commercial/industrial settings. It is the 95th percentile job tenure of workers in manufacturing.

This combination of exposure frequency and exposure duration is expected to be conservative for the amount of time that workers are actually exposed to soil during outdoor activities, as routine workers spend the majority of their time indoors. USEPA (1991, 2014) has recommended the use of these values for evaluating high-end routine worker exposures.

Body Weight

The body weight of 80 kilograms (kg) is PADEP's (25 Pa Code § 250.307(d)) and USEPA's standard value for assessing exposure of adults (USEPA 2014).

Averaging Time

The averaging time for evaluating cancer risk is equal to a lifetime of 70 years, and the averaging time for evaluating noncancer risk is equal to the exposure duration (USEPA 1989).

5.1.4.2 Maintenance Workers

The exposure factors used for evaluating potential exposure of maintenance workers to soil and groundwater are as follows:

Soil Ingestion Rate

The ingestion rate of 100 mg/day is USEPA's recommended soil ingestion rate for outdoor workers engaged in high-intensity soil contact activities such as repairing underground utilities, repairing roadways or performing landscaping activities (USEPA 2002). This soil ingestion rate is proposed by

USEPA to reflect increased ingestion exposures experienced by workers during landscaping or other soil disturbing activities.

Soil Dermal Contact Rate and Absorption

The dermal contact rate is the product of the exposed skin surface area and soil-to-skin adherence factor. The exposed skin surface area of 3,527 cm²/day and the soil-to-skin adherence factor of 0.12 mg/cm² are USEPA's recommended values for evaluating RME in commercial/industrial settings (USEPA 2014). The exposed skin surface area is based on the weighted average of mean values for head, hands, and forearms.

Soil Exposure Frequency

The exposure frequency of 30 days/year is based on professional judgment regarding the number of days per year of maintenance activities involving soil contact. It is the number of workdays in 6 weeks of such activities, which is an estimate of the time needed to complete occasional subsurface maintenance activities. This exposure frequency is also consistent with a high-end exposure frequency expected for individuals charged with performing landscaping activities at the Site throughout a year (e.g., one day a week, every two weeks or about 26 days/year).

Inhalation Exposure Time

Maintenance workers are assumed to be at the Site with the potential to inhale vapors and particulates from site-related sources for 8 hours/day, the PADEP (25 Pa Code § 250.307(d)) and USEPA recommended value for full-time workers (USEPA 2009).

Groundwater Ingestion

The incidental groundwater ingestion rate is the product of the hourly ingestion rate and exposure time. The ingestion rate of 0.005 liters per hour is one-tenth of USEPA's recommended value for incidental ingestion while swimming (USEPA 1989) and represents a very conservative estimate of incidental groundwater ingestion that could occur while workers are in an excavation pit. The exposure time of 2 hours per day for contact with groundwater or surface water during maintenance activities is based on professional judgment.

Groundwater Dermal Contact

The exposed skin surface area of 3,527 cm² is based on the USEPA-recommended exposed skin surface area for evaluating high-end contact with soil by workers in industrial settings (USEPA 2014). Workers are conservatively assumed to be covered with groundwater over this exposed skin surface area for 2 hours per event. The chemical-specific permeability coefficient (K_p) for dermal absorption from groundwater is estimated following USEPA guidance (USEPA 1992, USEPA 2004b).

Groundwater Exposure Frequency

The exposure frequency of 15 days per year assumes that the maintenance work involves excavations that encounter groundwater for 5 days per week for 3 weeks per year, based on professional judgment. These exposure frequencies are expected to be conservative for the amount of time that workers are

actually exposed to groundwater (as opposed to the total time for maintenance or construction, which typically includes time not associated with excavation).

Groundwater Vapor Inhalation Exposure Time

Maintenance workers are assumed to be exposed to vapors from groundwater 2 hours per day while performing maintenance activities in groundwater, based on professional judgment.

Exposure Duration

An exposure duration of 10 years is used for maintenance worker exposure to soil or groundwater. The exposure duration of 10 years is supported by the analysis of Burmaster (2000), using data from the Bureau of Labor Statistics through February 1996, which indicated that 95th and 90th percentile job tenure of workers in construction is approximately 12.48 years and 7.7 years, respectively. The duration of 10 years is longer than the length of time that workers typically work in an occupation (USEPA 2014).

Body Weight

The body weight of 80 kg is PADEP's (25 Pa Code § 250.307(d)) and USEPA's standard value for assessing exposure of adults (USEPA 2014).

Averaging Time

The averaging time for evaluating cancer risk is equal to a lifetime of 70 years, and the averaging time for evaluating noncancer HI is equal to the exposure duration (USEPA 1989).

5.1.4.3 Construction Workers

The exposure factors used for evaluating potential exposure of construction workers to soil and groundwater are as follows:

Soil Ingestion Rate

The ingestion rate of 200 mg/day is the 90th percentile from the adult soil ingestion study published by Stanek et al. (1997). It is more appropriate than the 95th percentile (330 mg/day) from the same study, because in a study of only 10 adults, the 95th percentile is at or beyond the highest observed ingestion rate and, as such, has far more uncertainty than the 90th percentile. Using the 90th percentile is also consistent with USEPA and PADEP guidance on selecting exposure factors for estimating the RME.

Soil Dermal Contact Rate and Absorption

The dermal contact rate is the product of the exposed skin surface area and soil-to-skin adherence factor. The exposed skin surface area of 3,527 cm²/day and the soil-to-skin adherence factor of 0.12 mg/cm² are USEPA's recommended values for evaluating RME in commercial/industrial settings (USEPA 2014). The exposed skin surface area is based on the weighted average of mean values for head, hands, and forearms.

Soil Exposure Frequency

The exposure frequency of 250 days/year is based on professional judgment regarding the number of days of soil excavation or other high-intensity soil contact activities. This exposure frequency is expected to overestimate the amount of time that workers are actually exposed to soil in excavations or during other high-intensity soil contact activities (as opposed to the total time for construction, which typically includes time not associated with high-intensity soil contact activities). It is based on a 5-day work week and 50 weeks per year.

Inhalation Exposure Time

Construction workers are assumed to be at the Site with the potential to inhale vapors and particulates from site-related sources for 8 hours/day, the PADEP (25 Pa Code § 250.307(d)) and USEPA recommended value for full-time workers (USEPA 2009).

Groundwater Ingestion

The incidental groundwater ingestion rate is the product of the hourly ingestion rate and exposure time. The ingestion rate of 0.005 liters per hour is one-tenth of USEPA's recommended value for incidental ingestion while swimming (USEPA 1989) and represents a very conservative estimate of incidental groundwater ingestion that could occur while workers are in an excavation pit. The exposure time of 2 hours per day for contact with groundwater during construction activities is based on professional judgment.

Groundwater Dermal Contact

The exposed skin surface area of 3,527 cm² is based on the USEPA-recommended exposed skin surface area for evaluating high-end contact with soil by workers in industrial settings (USEPA 2014). Workers are conservatively assumed to be covered with groundwater over this exposed skin surface area for 2 hours per event. K_p for dermal absorption from groundwater is estimated following USEPA guidance (USEPA 1992, USEPA 2004b).

Groundwater Exposure Frequency

The exposure frequency of 15 days per year assumes that the construction work involves excavations that encounter groundwater for 5 days per week for 3 weeks per year, based on professional judgment.

Groundwater Vapor Inhalation Exposure Time

Construction workers are assumed to be exposed to vapors from groundwater 2 hours per day while performing maintenance activities in groundwater, based on professional judgment.

Exposure Duration

The exposure duration of 1 year is based on professional judgment regarding the duration of site redevelopment activities at the Site that will involve earthmoving.

Body Weight

The body weight of 80 kg is PADEP's (25 Pa Code § 250.307(d)) and USEPA's standard value for assessing exposure of adults (USEPA 2014).

5.1.4.4 Nonpotable Use

The exposure factors used for evaluating potential exposure to groundwater through a hypothetical scenario where groundwater is used to fill a backyard wading pool ("kiddie" pool) are as follows:

Exposure Frequency and Duration

The exposure frequency for the kiddie pool scenario is 96 days/year, which is based on 4 days per week for the number of months, 6 months, when the average daily temperature is above 65 degrees Fahrenheit in Philadelphia, Pennsylvania (NOAA 2018). Residents are assumed to be exposed to groundwater for 26 years (6 years as children and 20 years as adults; USEPA 2014). This combination of exposure frequency and exposure duration is expected to be conservative for the amount of time that residents would actually spend using groundwater for nonpotable purposes off-facility.

Incidental Water Ingestion

The rate of 0.05 L/hour is the USEPA-recommended value for ingestion of water while swimming (USEPA 1989).

Dermal Contact Rate

The exposed skin surface areas of 6,365 cm² and 19,652 cm² are USEPA's recommended values for evaluating RME with groundwater by children and adults, respectively (USEPA 2014). Child and adult residents are assumed to wade in the pool for 2 hours per event, and one event per day, based on professional judgment. The absorbed dose for organic constituents is estimated using the nonsteady-state approach (USEPA 2004b), which is more conservative than the steady-state approach (USEPA 1989), particularly for hydrophobic constituents. The permeability coefficient (K_p) for dermal absorption of organic constituents from groundwater is estimated following USEPA guidance (USEPA 2004b).

5.2 Toxicity Assessment

In accordance with 25 Pa Code § 250.602(c)(3), this section presents the toxicity assessment. A toxicity assessment identifies potential adverse health effects that are associated with exposure to constituents and determines the dose response relationship between exposure and the occurrence of adverse effects.

The toxicity values used in this risk assessment are compiled from USEPA's hierarchy of sources (USEPA 2003), as follows:

1. Integrated Risk Information System;
2. Provisional Peer Reviewed Toxicity Values; and
3. Other Toxicity Values.

When a toxicity value is not available from the first two tiers of the hierarchy, other USEPA and non-USEPA sources (e.g., Agency for Toxic Substances and Disease Registry) of toxicity values are considered.

The toxicity values used in the risk assessment and their sources are summarized in **Appendix A**. The toxicity values used in this risk assessment are current as of January 9, 2023.

5.2.1 Cancer Toxicity Values

For constituents that USEPA assessed prior to the Guidelines for Carcinogen Risk Assessment (USEPA 2005), USEPA considers constituents belonging to the following cancer weight of evidence groups as human carcinogens:

- Group A - Known Human Carcinogen: Sufficient evidence of carcinogenicity in humans;
- Group B1 - Probable Human Carcinogen: Limited evidence of carcinogenicity in humans;
- Group B2 - Probable Human Carcinogen: Sufficient evidence of carcinogenicity in animals with inadequate or lack of evidence in humans; and
- Group C - Possible Human Carcinogen: Limited evidence of carcinogenicity in animals and inadequate or lack of evidence in humans.

For constituents that USEPA assessed after the *Guidelines for Carcinogen Risk Assessment* (USEPA 2005), USEPA uses the following cancer weight of evidence groups:

- Carcinogenic to Humans
- Likely to be Carcinogenic to Humans
- Suggestive Evidence of Carcinogenic Potential
- Inadequate Information to Assess Carcinogenic Potential

As shown in **Appendix A**, some of the constituents in this risk assessment are not designated as Group A or as being “Carcinogenic to Humans”, which means USEPA acknowledges that there is either inadequate evidence or a lack of evidence that these constituents cause cancer in humans. Therefore, evaluating these constituents as human carcinogens in the risk assessment is conservative.

Cancer slope factors (SFs) and unit risk factors (URFs) for these constituents and their sources are shown in **Appendix A**. The oral SFs and inhalation URFs represent 95 percent upper confidence bounds on the probability of getting cancer over a lifetime per unit dose. As recognized by USEPA, there is significant scientific evidence that some of the SFs and URFs may be overly conservative and may ignore the potential existence of threshold doses. Nonetheless, they are used here as assessment tools.

5.2.2 Noncancer Toxicity Values

Constituents designated by USEPA as belonging to the cancer weight-of-evidence Group D (Not Classifiable as to Human Carcinogenicity) are considered noncarcinogens. Constituents not designated as belonging to any cancer group are also treated as noncarcinogens. Chronic and subchronic reference doses (RfDs) and chronic and subchronic inhalation reference concentrations (RfCs) and their sources are shown in **Appendix A**.

The oral RfDs and inhalation RfCs represent estimates of the daily exposure to the human population, including sensitive subpopulations (e.g., children), which are likely to be without an appreciable risk of deleterious effects during a lifetime. These RfDs and RfCs typically incorporate several safety factors to account for uncertainties in their derivation, which in combination often result in overall uncertainty factors of 1,000 or more. Furthermore, for many constituents, there is significant scientific debate about the validity of these RfDs and RfCs, and the association of these doses and concentrations to potential adverse health consequences. Nonetheless, the RfDs and RfCs are used here as conservative assessment tools.

5.2.3 Extrapolation of Toxicity Values

The USEPA sources of toxicity values listed above do not provide dermal toxicity values for any of the constituents. Therefore, oral toxicity values (i.e., oral SFs and RfDs) are used as dermal toxicity values in this risk assessment. Adjustments to the oral toxicity values, where appropriate, are made in this route-to-route extrapolation following USEPA guidance (USEPA 2004b).

The USEPA sources of toxicity values listed above do not provide inhalation toxicity values (URFs and RfCs) for all of the constituents. Route-to-route extrapolation from oral toxicity values was not performed to obtain inhalation toxicity values for these constituents, consistent with USEPA guidance on performing inhalation risk assessments (USEPA 2009).

Uncertainties introduced by using extrapolated toxicity values are discussed in Section 5.4.3.

5.3 Risk Characterization

The health significance of the potential exposures described in Section 5.1.1 is discussed in the following subsections. Section 5.3.1 describes the methods for estimating cancer risks and noncancer HIs. Section 5.3.2 discusses the risk estimates and the significance of the potential exposures for each receptor population/exposure scenario.

5.3.1 Cancer and Noncancer Risks

In accordance with 25 Pa Code § 250.602(c)(4), this section presents the risk characterization performed to conservatively quantify the cancer risk and noncancer HI for receptors potentially exposed to COPCs in soil and groundwater at the Site.

The cancer risk associated with potential exposure to a carcinogenic constituent via ingestion and dermal contact is calculated by multiplying an estimate of the lifetime average daily dose for a particular exposure scenario by the cancer SF for the constituent as follows:

$$Risk = LADD \cdot SF$$

For the inhalation route, the cancer risk is calculated using the constituent concentration in air (C_{air}) and the URF, as follows:

$$Risk = URF \cdot C_{air} \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

Where ET is exposure time, EF is exposure frequency, ED is exposure duration, and averaging time for carcinogens (AT_c) is the averaging time for carcinogens.

The noncancer hazard quotient (HQ) associated with potential exposure via incidental ingestion and dermal contact is calculated by dividing an estimate of the average daily dose by the RfD for the constituent as follows:

$$HQ = \frac{ADD}{RfD}$$

For the inhalation route, the HQ is calculated using C_{air} and the RfC, as follows:

$$HQ = \frac{C_{air}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

Unit cancer risks and unit HQs are calculated for a unit constituent concentration (C_{unit}). C_{unit} is 1 milligram per kilogram (mg/kg) for soil and 1 milligram per liter (mg/L) for groundwater. Because risk estimates scale directly with the constituent concentration (except for cancer risk estimates at very high doses), these unit risks and unit HQs can be calculated once and used to calculate cancer and noncancer risk estimates efficiently for a large number of locations by multiplying the constituent concentrations for each location by the unit risks and unit HQs. Unit risks/HQs can also be used to derive RBSLs at a given target cancer risk level (TCRL) or target hazard quotient (THQ). The unit risks and unit HQs for all routes of exposure (incidental ingestion, dermal contact, vapor inhalation, and/or particulate inhalation) for a given receptor to constituents in a given environmental medium are conservatively summed to produce a single unit risk and unit HQ for each constituent. The cancer risk and noncancer HQ for a particular constituent i at a particular location are calculated as follows:

$$Risk_i = \frac{C_i \cdot UnitRisk_i}{C_{unit}}$$

$$HQ_i = \frac{C_i \cdot UnitHQ_i}{C_{unit}}$$

The media-specific cumulative cancer risk and noncancer HI from exposure to the combination of COPCs are estimated following USEPA (1989) guidance, as follows:

$$Cumulative\ Risk = \sum_i Risk_i$$

$$Hazard\ Index = \sum_i HQ_i$$

Where $Risk_i$ is the estimated cancer risk for the i^{th} constituent and HQ_i is the HQ for the i^{th} constituent. This approach may result in estimates of media-specific cumulative cancer risk and HI that are more conservative than necessary. For example, different COPCs may cause different and unrelated noncancer health effects, so summing the HQs for their individual effects would overestimate the significance of their combined effects. Nonetheless, this approach is used here as a conservative assessment tool.

Estimated media-specific cumulative cancer risks for each receptor population identified in **Table 3** are compared to PADEP’s risk management goals established in 25 Pa Code § 250.402(b). Specifically, cumulative cancer risks were compared to a risk of 1×10^{-4} while noncancer HIs are compared to an HI of 1.¹⁵ Risk estimates equal to or below these goals represent levels which would not warrant risk management action.

In order to support site characterization decision-making, RBSLs from unit cancer risks and unit noncancer HQs are also calculated. Unit cancer risks/HQs for each route (*i*) of exposure (e.g., ingestion, dermal contact, inhalation) are used to derive RBSLs for each receptor-specific exposure scenario. RBSLs are calculated at a TCRL of 1×10^{-5} and a THQ of 0.1. The TCRL and THQ are used with consideration for the risk management goals established in 25 Pa Code § 250.402(b) for attainment of the Site-Specific Standard (i.e., a cumulative excess cancer risk greater than 1×10^{-4} and a noncancer HI¹⁶ greater than 1).

$$\text{Cancer RBC}_i = \frac{C_{unit} \cdot TCRL}{UnitRisk_i}$$

$$\text{Noncancer RBC}_i = \frac{C_{unit} \cdot THQ}{UnitHQ_i}$$

The RBCs for each route (*i*) are conservatively combined to give cancer and noncancer-based RBCs as follows:

$$RBSL = \left(\sum_i RBSL_i^{-1} \right)^{-1}$$

Appendix B provides specific details on how the RBSLs for soil and groundwater were calculated using the general approach discussed above and the general assumptions provided in Sections 5.1 and 5.2.

5.3.2 Risk Characterization for Potentially Exposed Populations

The risk characterizations for routine workers, maintenance workers, and construction workers are summarized in this section. The lead exposure, nonpotable groundwater use, soil migration-to-groundwater, and groundwater migration-to-surface water pathway evaluations are also presented. Further details regarding the scenarios for potential human exposure are summarized in **Table 4**.

¹⁵ Per PADEP’s request, cumulative cancer risks and noncancer HIs greater than 1.0×10^{-4} and 1.0 respectively, have also been identified as potentially warranting risk management. While this approach has been used in support of this project, it is Terraphase’s position that USEPA’s risk assessment and risk management guidance, as well as PA’s regulations and guidance indicate that rounding risk estimates to one significant figure is appropriate. Presenting risk characterization results with one significant figure is standard practice, and we are not aware of any scientific basis that would justify presenting the risk characterization results with more than one significant figure. As USEPA (2004) noted, doing so would imply a level of precision that cannot be justified.

¹⁶ As estimated from exposure to constituents with the same target organ or target effect.

5.3.2.1 Routine Workers

Soil Contact and Soil Vapor Intrusion

As discussed in Section 5.1.1, routine workers could be exposed to soil in unpaved or uncovered areas during time spent outdoors. Routine workers could also be exposed to constituents in soil via inhalation of constituents if they were to volatilize into the outdoor air or migrate through cracks in the building foundation into indoor air. This section presents the results of risk calculations performed to characterize the risks associated with these exposures.

Potential exposure of routine workers to COPCs in soil is evaluated in this risk assessment by assuming the following two alternate hypothetical future cases:

- (1) All soil at the Site is uncovered and workers are assumed to be exposed to COPCs in soil while outdoors for the entire work-day through incidental ingestion, dermal contact, and inhalation of particulates and vapors in outdoor air, or
- (2) the soil is under an occupied generic commercial building to be constructed in the future, and workers are assumed to be exposed to COPCs in the soil via inhalation of vapor in indoor air (vapor intrusion) for the entire work-day.

Calculating risks for these alternate hypothetical cases is conservative and efficient because it avoids the need to prorate the portion of the day spent indoors and/or outdoors, and risk estimates for any combination of indoor and outdoor time periods would not exceed the higher of the risk estimates for the two alternative hypothetical cases.

Potential exposures for each hypothetical future case are evaluated by initially calculating upper-bound estimates of RME cumulative cancer risk and HIs to streamline the risk assessment. These estimates are calculated using the highest observed concentrations for all constituents detected in soil regardless of depth. These estimates are conservative upper-bound estimates because the site-related RME risks for an area would be lower if they were calculated using: (1) concentrations representative of the average concentrations to which receptors would be exposed at the area; and (2) site-specific exposure factors that account for the magnitude, frequency, and duration of exposures appropriate for the area.

The upper-bound estimates of cumulative cancer risk and HI for potential future exposure of routine workers for each alternate hypothetical case (i.e., all-day exposure to COPCs in soil during outdoor activities or all-day exposure to soil COPCs via vapor intrusion) are presented in **Table 5**.

Outdoor Direct Contact Exposure to Soil

As shown in **Table 5**, for the hypothetical case of a routine worker exposed to COPCs in soil during outdoor activities, the upper-bound cumulative cancer risk (3×10^{-4}) and noncancer HI (4) estimates are greater than PADEP's cumulative cancer and noncancer HI risk management goals of 1×10^{-4} and 1, respectively. As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk estimate is predominately driven by benzene and BaP. The unacceptable upper-bound HI is predominantly driven by benzene, cumene, and BaP.

A more reasonable but still conservative estimate of the RME risk and HI for potential routine worker to COPCs in soil is estimated using a refined exposure concentration for COPCs contributing most to these exposure area risk estimates: benzene, cumene, toluene, 124-TMB, xylenes (total), BaP, and naphthalene. For all other COPCs, the maximum detected concentrations are used. As discussed in Section 5.1.2, the refined exposure concentration is estimated by conservatively calculating the 95 percent UCL on the mean concentration in soil in the exposure area. For expediency, this UCL is calculated using the maximum concentrations from any depth at each soil sampling location. As shown on **Table 6**, using the refined exposure concentration for benzene (1,278 mg/kg), cumene (3,764 mg/kg), toluene (1,168 mg/kg), 124-TMB (36.4 mg/kg), xylenes (total) (110.4 mg/kg), BaP (3.9 mg/kg), and naphthalene (4.4 mg/kg), the RME risk and HI estimates for routine worker exposure to COPCs in soil are 3×10^{-5} and 0.5, respectively. These estimates are below the risk management goals of 1×10^{-4} and 1. Therefore, potential routine worker direct contact exposure to COPCs in soil would not result in unacceptable risk/HI.

Vapor Intrusion Exposure from Soil (into a Future Nonresidential Building)

As also shown in **Table 5**, for the hypothetical case of a routine worker exposed to COPCs in soil via vapor intrusion, the upper-bound cumulative cancer risk (3×10^{-2}) and noncancer HI (400) estimates are greater than the risk management goals of 1×10^{-4} and 1, respectively. As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk estimate is predominately driven by benzene and naphthalene. The potentially unacceptable upper-bound HI is predominately driven by benzene, cumene, toluene, 124-TMB, 135-TMB, xylenes (total), and naphthalene.

To support and guide risk management decisions (e.g., further sampling, further assessment, vapor mitigation, remediation, etc.), upper-bound estimates of cumulative cancer risk and HI were also calculated on a point-by-point basis, using the highest observed concentration for all COPCs from any depth at each location. As discussed in Section 5.1.2.1, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 7** and **Figure 6**, 15 soil sampling locations (i.e., GPR790-01, GPR790-02, GPR790-05, GPR791-01, GPR791-03, GPR791-04, GPR791-06, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-07, GPR794-08, and GPR798-04) exhibited a cancer risk greater than the risk management goal. 31 soil sampling locations (i.e., GPR1116-07, GPR1117-03, GPR790-01, GPR790-02, GPR790-05, GPR791-01, GPR791-03, GPR791-04, GPR791-06, GPR792-01, GPR792-02, GPR792-03, GPR792-04, GPR792-05, GPR792-06, GPR792-07, GPR793-01, GPR793-02, GPR793-03, GPR793-04, GPR793-05, GPR793-06, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-07, GPR794-08, GPR798-04, and GPR799-08) exhibited a noncancer HI estimate greater than the risk management goal.

Based upon this risk characterization, further consideration for risk management action due to routine worker vapor intrusion exposure to COPCs in soil (i.e., benzene, cumene, toluene, 124-TMB, 135-TMB, xylenes (total), and naphthalene) at these locations would be warranted.

Groundwater Vapor Intrusion Exposure (into a Future Nonresidential Building) – Current Extent

Routine workers could be exposed to COPCs in shallow groundwater to the extent that such COPCs volatilize and migrate through cracks in future building foundations into indoor air. The cumulative cancer risk and noncancer HI estimates for routine worker exposure to groundwater via vapor intrusion are calculated using the highest observed concentrations for all constituents detected in groundwater.

As shown in **Table 8**, taking into consideration the groundwater sampling results from the source area monitoring wells installed and sampled by PESRM, for the hypothetical case of a routine worker exposed to COPCs in groundwater via vapor intrusion, the upper-bound cumulative cancer risk is estimated to be 5×10^{-4} and the noncancer HI is estimated to be 6, greater than the risk management goals of 1×10^{-4} and 1, respectively. Taking into consideration the most recent groundwater sampling results from each of the existing monitoring wells in the area (previously installed by Evergreen), similar estimates of cumulative cancer risk (7×10^{-4}) and noncancer HI (9) are estimated.

As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk estimate and HI are predominately driven by benzene.

To support and guide risk management decisions (e.g., further sampling, further assessment, vapor mitigation, remediation, etc.), upper-bound estimates of cumulative cancer risk and HI were also calculated on a point-by-point basis using the highest observed concentration for all COPCs from each groundwater well. As discussed in Section 5.1.2.2, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 9** and **Figure 7**, seven wells (i.e., TG07-MW-07, B-149, B-150, B-154, B-155, B-177, and B-179) exhibit COPC concentrations estimated to result in groundwater vapor intrusion cancer risk and/or HI greater than the risk management goals.

Based upon this risk characterization, further consideration for risk management action due to routine worker vapor intrusion exposure to COPCs in groundwater (i.e., benzene) at these locations would be warranted.

Groundwater Vapor Intrusion Exposure (into a Future Nonresidential Building) – Future Extent

As described in Section 5.1.3.9, where unacceptable risk via exposure to groundwater has been identified, a 2-dimensional fate and transport model, QD, is used to calculate the maximum potential future downgradient extent of the unacceptable risk/HI. The modeling demonstrates that after 30 years, concentrations of COPC that present a potentially unacceptable risk to routine workers (i.e., benzene) could extend as far as 148 ft downgradient of TG07-MW-07.

The results of the QD modeling are depicted in **Figure 7** and **Appendix A, Attachment 8**.

Groundwater Volatilization to Outdoor Air Exposure

Routine workers could be exposed to COPCs in shallow groundwater to the extent that such COPCs volatilize and migrate into outdoor air. As shown in **Table 4**, taking into consideration the groundwater sampling results from the source area monitoring wells installed and sampled by PESRM, the upper-bound cumulative cancer risk (3×10^{-6}) and noncancer HI (0.04) estimates are below PADEP's cumulative

cancer and noncancer HI risk management goals of 1×10^{-4} and 1, respectively. Therefore, potential routine worker exposure to COPCs in groundwater via volatilization to outdoor air would not result in unacceptable risk/HI. Taking into consideration the most recent groundwater sampling results from each of the existing monitoring wells in the area (previously installed by Evergreen), similar estimates of cumulative cancer risk (4×10^{-6}) and noncancer HI (0.05) are estimated.

5.3.2.2 Maintenance Workers

Outdoor Direct Contact Exposure to Soil

As discussed in Section 5.1.1, maintenance workers could be exposed to COPCs in soil in the future during regular maintenance activities (e.g., landscaping, underground utility repairs, etc.) following site redevelopment activities. This section presents the results of risk calculations performed to characterize the risks associated with these exposures.

Potential exposures are evaluated by initially calculating upper-bound estimates of RME cumulative cancer risk and HIs to streamline the risk assessment. These estimates are calculated using the highest observed concentrations for all constituents detected in soil regardless of depth.

As shown on **Table 5**, the upper-bound estimates of cumulative cancer risk and HI for potential exposure of maintenance workers to soil are 5×10^{-5} and 2, respectively. The upper-bound estimate of cumulative cancer risk is less than the risk management goal of 1×10^{-4} . The upper-bound estimate of HI of 2 is greater than the risk management goal of 1. As shown in **Appendix A, Attachment 7**, this upper-bound HI is predominantly driven by benzene and cumene.

A more reasonable but still conservative estimate of the HI for potential maintenance worker RME to COPCs in soil is estimated using a refined exposure concentration for COPCs contributing most to the exposure area HI estimate (i.e., benzene and cumene). Because refined exposure concentrations for toluene, 124-TMB, xylenes (total), BaP, and naphthalene were already estimated for the exposure area, refined exposure concentrations for these constituents are also used. For all other COPCs, the maximum detected concentrations are used.

As discussed in Section 5.1.2, the refined exposure concentration is estimated by conservatively calculating the 95 percent UCL on the mean concentration in soil. For expediency, this UCL is calculated using the maximum concentrations from any depth at each soil sample location. As shown on **Table 6**, using the refined exposure concentration for benzene (1,278 mg/kg), cumene (3,764 mg/kg), toluene (1,168 mg/kg), 124-TMB (36.4 mg/kg), xylenes (total) (110.4 mg/kg), BaP (3.9 mg/kg), and naphthalene (4.4 mg/kg), the RME HI estimate for maintenance worker exposure to COPCs is 0.2, below the risk management goal of 1. Therefore, potential maintenance worker exposure to COPCs in soil would not result in unacceptable risk.

Outdoor Direct Contact Exposure to Groundwater – Current Extent

Maintenance workers could be directly exposed to COPCs in shallow groundwater during occasional subsurface maintenance or excavation activities that encounter groundwater. Exposure to groundwater could include incidental ingestion, dermal contact, and inhalation of vapors in outdoor air.

As shown in **Table 8**, taking into consideration the groundwater sampling results from the source area monitoring wells installed and sampled by PESRM, for the hypothetical case of a maintenance worker exposed to COPCs in groundwater via direct contact, the upper-bound cumulative cancer risk is estimated to be 6×10^{-4} and the noncancer HI is estimated to be 20, greater than the risk management goals of 1×10^{-4} and 1, respectively. Taking into consideration the most recent groundwater sampling results from each of the existing monitoring wells in the area (previously installed by Evergreen), similar estimates of cumulative cancer risk (8×10^{-4}) and noncancer HI (20) are estimated.

As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk and HI are predominately driven by benzene.

To support and guide risk management decisions, upper-bound estimates of cumulative cancer risk and HI were also calculated on a point-by-point basis using the highest observed concentration for all COPCs from each groundwater well. As discussed in Section 5.1.2.2, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 9** and **Figure 7**, seven wells (i.e., TG07-MW-07, B-149, B-150, B-154, B-155, B-177, and B-179) exhibit COPCs concentrations estimated to result in groundwater vapor intrusion cancer risk and/or HI greater than the risk management goals.

Based upon this risk characterization, further consideration for risk management action due to maintenance worker exposure to COPCs in groundwater (i.e., benzene) at these locations would be warranted.

Outdoor Direct Contact Exposure to Groundwater – Future Extent

As described in Section 5.1.3.9, where unacceptable risk via exposure to groundwater has been identified, a 2-dimensional fate and transport model, QD, is used to calculate the maximum potential future downgradient extent of the unacceptable risk. The modeling demonstrates that after 30 years, concentrations of COP that present a potentially unacceptable risk to maintenance workers (i.e., benzene) could extend as far as 257 ft downgradient of TG07-MW-07.

The results of the QD modeling are depicted in **Figure 7** and **Appendix A, Attachment 8**.

5.3.2.3 Construction Workers

Outdoor Direct Contact Exposure to Soil

As discussed in Section 5.1.1, construction workers could be exposed to soil in the future during site redevelopment activities. This section presents the results of risk calculations performed to characterize the risks associated with these exposures.

Potential exposures are evaluated by initially calculating upper-bound estimates of RME cumulative cancer risk and HIs to streamline the risk assessment. These estimates are calculated using the highest observed concentrations for all constituents detected in soil regardless of depth.

As shown on **Table 5**, the upper-bound estimates of cumulative cancer risk and HI for potential exposure of construction workers to soil are 3×10^{-4} and 40, respectively, greater than PADEP's cumulative cancer and noncancer HI risk management goals. As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk estimate is predominately driven by benzene. The potentially unacceptable upper-bound HI is predominately driven by benzene, cumene, toluene, 124-TMB, xylenes (total), BaP, and naphthalene.

A more reasonable but still conservative estimate of the risk and HI for potential construction worker RME to COPCs in soil is estimated using a refined exposure concentration for benzene, cumene, toluene, 124-TMB, xylenes (total), BaP, and naphthalene in the exposure area. For all other COPCs, the maximum detected concentrations are used.

As discussed in Section 5.1.2, the refined exposure concentration is estimated by conservatively calculating the 95 percent UCL on the mean concentration in soil. For expediency, this UCL is calculated using the maximum concentrations from any depth at each soil sample location. As shown on **Table 6**, using the refined exposure concentration for benzene (1,278 mg/kg), cumene (3,764 mg/kg), toluene (1,168 mg/kg), 124-TMB (36.4 mg/kg), xylenes (total) (110.4 mg/kg), BaP (3.9 mg/kg), and naphthalene (4.4 mg/kg), the RME risk and HI estimates for construction worker exposure to COPCs in soil are 3×10^{-5} and 5, respectively. The upper-bound estimate of cumulative cancer risk is less than the risk management goal of 1×10^{-4} . The upper-bound estimate of HI of 5 is greater than the risk management goal of 1. Therefore, potential construction worker exposure to COPCs in soil could result in unacceptable HI.

To support and guide risk management decisions, upper-bound estimates of cumulative cancer risk and HIs were calculated on a point-by-point basis, using the highest observed concentration for all COPCs from any depth at each location. As discussed in Section 5.1.2.1, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 7** and **Figure 6**, 21 soil sampling locations (i.e., GPR790-01, GPR790-05, GPR791-01, GPR791-04, GPR792-01, GPR792-02, GPR792-03, GPR792-04, GPR792-05, GPR792-06, GPR793-01, GPR793-02, GPR793-03, GPR793-04, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-08, and GPR798-04) exhibited a HI greater than the risk management goal.

Based upon this risk characterization, further consideration for risk management action due to construction worker exposure to COPCs in soil (i.e., benzene, cumene, toluene, 124-TMB, xylenes (total), BaP, and naphthalene) at these locations would be warranted.

Outdoor Direct Contact Exposure to Groundwater – Current Extent

During redevelopment or site construction activities that encounter groundwater, construction workers could be directly exposed to COPCs in shallow groundwater via incidental ingestion, dermal contact, and inhalation of vapors in outdoor air.

As shown in **Table 8**, taking into consideration the groundwater sampling results from the source area monitoring wells installed and sampled by PESRM, for the hypothetical case of a construction worker exposed to COPCs in groundwater via direct contact, the upper-bound cumulative cancer risk is

estimated to be 6×10^{-5} and the noncancer HI is estimated to be 6. The upper-bound estimate of cumulative cancer risk is less than the risk management goal of 1×10^{-4} . The upper-bound estimate of noncancer HI of 6 is greater than the risk management goal of 1. Taking into consideration the most recent groundwater sampling results from each of the existing monitoring wells in the area (previously installed by Evergreen), similar estimates of cumulative cancer risk (8×10^{-5}) and noncancer HI (9) are estimated.

As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound HI are predominately driven by benzene.

To support and guide risk management decisions, upper-bound estimates of cumulative cancer risk and HI were also calculated on a point-by-point basis using the highest observed concentration for all COPCs from each groundwater well. As discussed in Section 5.1.2.2, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 9** and **Figure 7**, seven wells (i.e., TG07-MW-07, B-149, B-150, B-154, B-155, B-177, and B-179) exhibited an HI greater than the risk management goal.

Based upon this risk characterization, further consideration for risk management action due to construction worker exposure to COPCs in groundwater (i.e., benzene) at these locations would be warranted.

Outdoor Direct Contact Exposure to Groundwater – Future Extent

As described in Section 5.1.3.9, where unacceptable risk via exposure to groundwater has been identified, a 2-dimensional fate and transport model, QD, is used to calculate the maximum potential future downgradient extent of the unacceptable HI. The modeling demonstrates that after 30 years, concentrations of COPCs that present a potentially unacceptable risk to construction workers (i.e., benzene) could extend as far as 151 ft downgradient of TG07-MW-07.

The results of the QD modeling are depicted in **Figure 7** and **Appendix A, Attachment 8**.

5.3.2.4 Nonpotable Groundwater Use

Current Extent

Potential exposures to COPCs in groundwater via nonpotable groundwater use are evaluated using a hypothetical scenario where groundwater is used to fill a backyard wading pool (“kiddie” pool), described in **Appendix A**. This scenario represents a reasonable worst case exposure scenario in which the estimated exposure is expected to be higher than those associated with other nonpotable uses (e.g., watering lawns, washing cars). Potential routes of exposure in this scenario include incidental ingestion, dermal contact, and inhalation of vapors.

The cumulative cancer risk and noncancer HI estimates for receptor exposure to groundwater via nonpotable use are calculated using the highest observed concentrations for all constituents detected in groundwater.

As shown in **Table 8**, taking into consideration that groundwater sampling results from the source area monitoring wells installed and sampled by PESRM, for nonpotable exposure to COPCs in groundwater, the upper-bound cumulative cancer risk is estimated to be 8×10^{-3} and the noncancer HI is estimated to be 40, greater than the risk management goals of 1×10^{-4} and 1, respectively. Taking into consideration the most recent groundwater sampling results from each of the existing monitoring wells in the area (previously installed by Evergreen), similar estimates of cumulative cancer risk (1×10^{-2}) and noncancer HI (50) are estimated for the unconfined aquifer. Estimates of risk and HI taking into consideration the most recent groundwater sampling results from the lower aquifer monitoring wells in the area results in an estimated cancer risk of 1×10^{-8} and noncancer HI of 0.00005.

As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk estimate and HI are predominately driven by benzene, toluene, and 1,2-dichloroethane.

To support and guide risk management decisions, upper-bound estimates of cumulative cancer risk and HI were also calculated on a point-by-point basis using the highest observed concentration for all COPCs from each unconfined groundwater well. As discussed in Section 5.1.2.2, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 9** and **Figure 7**, nine groundwater wells (i.e., TG07-MW-05, TG07-MW-07, B-149, B-150, B-154, B-155, B-177, B-178, and B-179) exhibit COPCs concentrations estimated to result in nonpotable groundwater use cancer risk and/or HI greater than the risk management goals.

Currently, on-site nonpotable groundwater is not reasonably expected and, therefore, risk management action to address this condition is not warranted.

Future Extent

As described in Section 5.1.3.9, where unacceptable risk via exposure to groundwater has been identified, a 2-dimensional fate and transport model, QD, is used to calculate the maximum potential future downgradient extent of the unacceptable risk in groundwater. The modeling demonstrates that after 30 years, concentrations of COPCs that present a potentially unacceptable risk via nonpotable groundwater use (i.e., benzene) could extend as far as 396 ft downgradient of TG07-MW-07 and 72 ft downgradient of TG07-MW-05. At this distance, the aerial extent of potential unacceptable risk is still on-site. Because on-site nonpotable groundwater use is not a current or reasonably expected future exposure scenario, risk management action to address this condition is not warranted.

The results of the QD modeling are depicted in **Figure 7** and **Appendix A, Attachment 8**.

5.3.2.5 Soil Migration-to-Groundwater Pathway

In order to evaluate the potential for subsurface soil to leach unacceptable concentrations to groundwater in the future, RBSLs were developed in accordance with the methodologies described in USEPA's (1996b) *Soil Screening Guidance: User's Guide*. Additional details describing the derivation of these screening levels are presented in Section 5.1.3.8. Upper-bound cancer risk and noncancer HI estimates were calculated by scaling off of the soil migration-to-groundwater RBSLs.

Soil migration-to-groundwater cumulative cancer risk and HI estimates were calculated for the following scenarios:

- Routine worker exposure to COPCs in groundwater via volatilization to outdoor air and vapor intrusion
- Construction worker exposure to COPCs in groundwater via direct contact
- Receptor exposure to COPCs in groundwater via nonpotable groundwater use

As shown in **Table 5**, the upper-bound cumulative cancer risk and HI estimates for soil migration-to-groundwater protective of routine worker groundwater exposure via volatilization to outdoor air and vapor intrusion and construction worker exposure to COPCs in groundwater via direct contact are below the risk management goals of 1×10^{-4} and 1, respectively. The upper-bound cumulative cancer risk and HI estimate for soil migration-to-groundwater protective of nonpotable groundwater use upper-bound cumulative cancer risk (1×10^{-3}) and noncancer HI (5) estimates are greater than the risk management goals of 1×10^{-4} and 1, respectively. As shown in **Appendix A, Attachment 7**, the unacceptable upper-bound cumulative cancer risk estimate and HI are predominately driven by benzene.

To support and guide risk management decisions, upper-bound estimates of cumulative cancer risk and HIs for this exposure scenario were also calculated on a point-by-point basis using the highest observed concentration for all COPCs from each soil sampling location. As discussed in Section 5.1.2.1, where a COPC is non-detect at a location but detected within the specific exposure media at the Site, $\frac{1}{2}$ the analytical limit at the location was used.

As shown on **Table 7** and **Figure 6**, 10 soil sampling locations (i.e., GPR790-05, GPR791-01, GPR791-04, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-08, and GPR798-04) exhibited a cancer risk greater than the risk management goal. Six soil sampling locations (i.e., GPR790-05, GPR794-02, GPR794-04, GPR794-05, GPR794-08, and GPR798-04) exhibited a noncancer HI estimate greater than the risk management goal.

As discussed in Section 5.1.3.7, exposure to COPCs in groundwater via nonpotable groundwater use is evaluated and concludes that currently, on-site nonpotable groundwater is not reasonably expected, and in the future the modeled extent of potential unacceptable risk remains on-site. Therefore, risk management action to address this condition is not warranted.

5.3.2.6 Groundwater Migration-to-Surface Water Pathway

In order to evaluate the potential for COPCs observed in groundwater in the area to adversely impact surface water in the future as a result of groundwater migration and discharge to surface water, COPC concentrations observed in the source area wells installed by PESRM were compared to the RBSLs developed for this pathway (**Appendix B**).

As shown in **Table 3**, benzene and cumene were detected at concentrations in groundwater above the MtSW screening levels of 130 mg/L and 2.6 mg/L, respectively. Benzene concentrations were greater than the MtSW screening level at TG07-MW-07. Cumene concentrations were greater than the MtSW screening level at TG07-MW-05, TG07-MW-07, and TG07-MW-08. These locations are also shown on

Figure 11. Soil concentrations greater than the soil migration-to-groundwater screening levels for this exposure pathway were identified in proximity to TG07-MW-05 and TG07-MW-07. The soil concentrations in proximity to TG07-MW-08 were less than the soil migration-to-groundwater screening levels for this pathway indicating that the contamination identified in groundwater may be unrelated to the AST.

As described in Section 5.1.3.9, because the potential for unacceptable risk via migration of groundwater-to-surface water was identified at these three locations, a 2-dimensional fate and transport model, QD, is used to calculate the maximum potential future downgradient extent of COPC concentrations which could pose a threat to surface water. The modeling demonstrates that after 30 years, concentrations of benzene that could pose a threat to surface water will only extend 49 ft downgradient of TG07-MW-07. Similarly, after 30 years, concentrations of cumene will only extend 2 ft downgradient of TG07-MW-07 and 3 ft downgradient of TG07-MW-05. The potential future extent of cumene concentrations in well TG07-MW-08 was not modeled due to the lack of an identified soil source (i.e., soil samples exceeding the soil migration to groundwater RBSL for cumene) in the vicinity of tank GP U 767.

While concentrations exist greater than the migration-to-surface water screening levels, none of the future extents of unacceptable concentrations reach the River and therefore do not warrant risk management action.

5.3.2.7 Exposure to Lead in Soil

Exposure of routine workers, maintenance workers, and construction workers to lead in soil during outdoor activities is evaluated using a screening level of 2,520 mg/kg. This screening level is calculated following USEPA guidance (USEPA 2003), including updates (USEPA 2009, 2017a). The derivation of the industrial soil screening level is presented in **Appendix B**. As shown on **Table 2**, the concentrations of lead in soil range from 3.7 mg/kg to 1,400 mg/kg and are all below the RBSL. Therefore, potential worker exposure to lead concentrations in soil at the Site would not result in unacceptable risk.

5.4 Uncertainty Analysis

While the Risk Assessment is conducted in accordance with PADEP and USEPA guidance, there may be some uncertainties associated with certain aspects of the risk assessment process. In general, the methods and assumptions used to complete the Risk Assessment are very conservative by design to account for such uncertainties. This section discusses potential uncertainties in the risk characterization and the potential impact (or lack thereof) such uncertainties could have on risk management decision-making.

5.4.1 Exposure Concentrations

The exposure concentrations in this risk assessment are predominantly based on the highest concentrations of COPCs detected in soil and groundwater or conservative refinements to the exposure concentrations (e.g., UCLs), performed only when an upper-bound estimate of the RME media-specific cumulative cancer risk or noncancer HI exceeds the risk management goals. This streamlines the risk

assessment by avoiding the calculation of refinements that would not materially change the risk assessment conclusions, the need for risk management action, or require additional sampling/characterization to support the refinements. However, this approach likely overestimates the cumulative cancer risk and noncancer HI estimates because these estimates are based on maximum detected concentrations. The use of maximum detected concentrations introduces more conservatism than necessary for RME estimates because it assumes simultaneous worst-case exposure. The overestimation of exposure concentrations results in risk and HI estimates that are closer to, or in excess of, PADEP's risk management goals than they would be if refinements were used.

Most exposure concentrations that are based on mathematical modeling of constituent transfer from soil or groundwater to air are conservative for the same reasons discussed above, since the model estimates are predominantly based on the use of maximum detected concentrations in soil or groundwater. In addition, some model estimates are conservative because they do not account for the reduction of constituent concentration or mass in the soil or groundwater as constituents transfer from these media. Even for models that account for reduction of mass in the soil (e.g., Jury model), risk calculations for ingestion and dermal contact with soil assume soil concentrations remain constant, which is consistent with USEPA and PADEP practice but contradicts the mass conservation principle. As a result, risk estimates that are based on the sum of risk estimates from soil and soil vapor/particulates are more conservative than necessary for RME estimates. These include almost all of the risk estimates discussed in Section 5.3.2.

Another factor that contributes to the likely overestimation of exposure concentrations is the assumption that the COPCs are entirely site-related. The concentrations of all constituents are assumed to be site-related in this risk assessment because the field investigation did not quantify site-specific background levels (i.e., concentrations not associated with a release from the Site, for example, fill-related constituent concentrations).

Considering all these factors, the exposure concentrations used in this risk assessment are more conservative than necessary for RME estimates and therefore likely result in an overestimation of risk and/or hazard.

5.4.2 Exposure Factors

As discussed in Section 5.1.4, most of the exposure factors used in the risk assessment are high-end (i.e., 90th to 95th percentile) estimates of the magnitude, frequency, and duration of potential exposures. When several such high-end factors are multiplied, the resulting estimates of dose will be higher than the 90th percentile of the distribution of exposures in the potentially exposed population and could be higher than the exposure to the maximally exposed individual, particularly when such exposure factors are combined with exposure concentrations that are based on maximum detected concentrations (as discussed above). The use of upper-bound exposure factors is likely to result in an overestimate of potential risks and/or hazards.

5.4.3 Extrapolated Toxicity Values

As discussed in Section 5.2, the dermal toxicity values used in the risk assessment are oral toxicity values that were extrapolated to the dermal route without constituent-specific judgment regarding whether such extrapolation might be appropriate for a particular constituent. This is consistent with USEPA guidance (2004b) and is a conservative approach to ensure that potential risk via the dermal route is not overlooked. However, some constituents might exhibit different degrees of toxicity for the dermal route relative to the oral route. For such constituents, the extrapolation approach used in the risk evaluation could introduce uncertainty.

5.4.4 Risk Characterization

The summation of cancer risks and HQs for multiple COPCs is based upon USEPA guidance (1989) to assume dose additivity, which means that constituents in a mixture are assumed to have no synergistic or antagonistic interactions and each constituent has the same mode of action and elicits the same health effects. In general, this approach can introduce significant uncertainty with the over- or underestimation of risk and/or hazard. However, because only a few constituents contribute to the cumulative risk and HI estimates, the impact of this uncertainty on the outcome of the risk assessment is likely to be minimal.

5.5 Summary

This report documents the methodology and results of a site-specific human health risk assessment performed to support a demonstration that conditions at Tank Group 07 meet the tank closure performance standard in accordance with Act 32. The potential risks are characterized based upon the RME under the current and reasonably expected future land and groundwater uses at and around the Site.

The scope of the human health risk assessment calculations is summarized by the scenarios for potential human exposure as shown on **Table 4**. All soil and groundwater data collected in accordance with the Work Plan and SAP were considered in this Risk Assessment.

Tables 5 through 10 present the results of the soil and groundwater risk calculations and which exposure scenarios would present an unacceptable risk and would warrant risk management action. Likewise, **Figures 6 and 7** present the spatial distribution of potentially unacceptable risks for soil and groundwater, respectively, and the general locations where risk management action would be warranted due to unacceptable risks/HIs for specific exposure scenarios.

As discussed in Section 5.3, the Risk Assessment identifies potentially unacceptable risk/HI to routine workers (via vapor intrusion) and construction workers (via direct contact) from exposure to constituents of concern (COCs) in soil in the area of Tank Group 07. It also identifies potentially unacceptable risk/HI to routine workers (via vapor intrusion), maintenance workers (via direct contact), and construction workers (via direct contact) from exposure to COCs in groundwater in the area of Tank Group 07.

The following discusses these results by environmental media and locations on the Site that would warrant consideration for risk management action.

5.5.1 Soil

As presented on **Table 7**, locations with soil COPCs concentrations that could result in cumulative cancer risk and/or HI estimates for potential routine workers via vapor intrusion from soil that are above the risk management goals include GPR1116-07, GPR1117-03, GPR790-01, GPR790-02, GPR790-05, GPR791-01, GPR791-03, GPR791-04, GPR791-06, GPR792-01, GPR792-02, GPR792-03, GPR792-04, GPR792-05, GPR792-06, GPR792-07, GPR793-01, GPR793-02, GPR793-03, GPR793-04, GPR793-05, GPR793-06, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-07, GPR794-08, GPR798-04, and GPR799-08. These unacceptable cancer risk and/or HI estimates are predominately driven by benzene, cumene, toluene, 124-TMB, 1,3,5-TMB, xylenes (total), and naphthalene.

As presented on **Table 7**, locations with soil COPCs concentrations that could result in HI estimates above the risk management goal for potential construction workers via soil direct contact soil include GPR790-01, GPR790-05, GPR791-01, GPR791-04, GPR792-01, GPR792-02, GPR792-03, GPR792-04, GPR792-05, GPR792-06, GPR793-01, GPR793-02, GPR793-03, GPR793-04, GPR794-01, GPR794-02, GPR794-04, GPR794-05, GPR794-06, GPR794-08, and GPR798-04. These unacceptable HI estimates are predominately driven by benzene, cumene, toluene, 124-TMB, xylenes (total), BaP, and naphthalene.

5.5.2 Groundwater

As presented on **Table 9**, locations with groundwater COPCs concentrations that could result in cumulative cancer risk and/or HI estimates above the risk management goals for potential routine workers via vapor intrusion from groundwater, maintenance worker groundwater direct contact, and construction worker groundwater direct contact include TG07-MW-07, B-149, B-150, B-154, B-155, B-177, and B-179. These unacceptable cancer risk and/or HI estimates are predominately driven by benzene.

6 Site-Specific Remediation Standards

As discussed in Section 5.3, the Risk Assessment identifies potentially unacceptable risk/HI to routine workers (via vapor intrusion) and construction workers (via direct contact) from exposure to COCs in soil in the area of Tank Group 07. It also identifies potentially unacceptable risk/HI to routine workers (via vapor intrusion), maintenance workers (via direct contact), and construction workers (via direct contact) from exposure to COCs in groundwater in the area of Tank Group 07.

Overall, potentially unacceptable risk/HI from exposure to soil in the area is driven by the following COCs:

- Benzene
- Cumene

- Toluene
- 124-TMB
- 135-TMB
- Xylenes (total)
- BaP
- Naphthalene

Potentially unacceptable risk/HI from exposure to groundwater is driven by the following COC:

- Benzene

As discussed in Section 7.3.3 of the Report, potentially unacceptable vapor intrusion exposures will be managed separately following additional characterization/evaluation and eventually through pathway elimination. In order to support remedial action planning for all other exposure pathways, site-specific standards (SSS) are proposed for these COCs. The proposed SSS will be used in the forthcoming Remedial Action Plan for Tank Group 07. **Table 10** presents the SSS and the resulting risk/HI that would be associated with exposure to soil at these concentrations. This includes direct contact exposure of construction workers to soil. Similarly, **Tables 11 through 12** present the SSS and the resulting risk/HI that would be associated with exposure to groundwater at these concentrations. This includes direct contact exposure of maintenance workers and construction workers to groundwater.

SSS were developed considering: (1) the cumulative risk management goals established under Act 2 (i.e., cumulative cancer risk of 1×10^{-4} and noncancer HI of 1); and (2) including the risk/HI posed by constituents other than the COCs detected in soil/groundwater at the Site. Assuming receptors are exposed to the maximum site-wide concentrations for every constituent except the COCs, achieving the SSS for the COCs would result in acceptable risk/HI for each of the relevant exposure scenarios.

The overall SSS that would achieve an acceptable risk/HI for receptor exposure to soil in the area are as follows¹⁷:

- Benzene: 130 mg/kg
- Cumene: 680 mg/kg
- Toluene: 1,200 mg/kg
- 124-TMB: 36 mg/kg
- Xylenes (total): 110 mg/kg
- BaP: 3.9 mg/kg
- Naphthalene: 4.4 mg/kg

The overall SSS that would achieve an acceptable risk/HI for groundwater is:

- Benzene: 11 mg/L

¹⁷ An SSS was not calculated for 135-TMB as it was only a COC for routine worker exposure via vapor intrusion.

7 Summary and Conclusions

This Risk Assessment was prepared in support of the *Site Characterization Report* for Tank Group 07 to document the methodology and results of a site-specific human health risk assessment performed in accordance with 25 Pa. Code § 250.409, to demonstrate that conditions at the Site meet the tank closure performance standard in accordance with Act 32.

As discussed in Section 3, based on the review of the soil and groundwater concentrations in comparison to the RBSLs and the spatial distribution of concentrations greater than these levels, the soil and groundwater sampling performed adequately defines the horizontal and vertical extent of COPCs to support a site-specific risk assessment.

Using soil and groundwater data collected in accordance with the Work Plan and the SAP and the methodologies as described in Section 5, cumulative cancer risk and noncancer HI estimates for the exposure of current and reasonably expected future receptor populations to COPCs in soil and groundwater were calculated. Exposure of routine workers to COCs via soil vapor intrusion and of construction workers to COCs via soil direct contact may warrant risk management action. Exposure of routine workers to COCs via groundwater vapor intrusion and of maintenance and construction workers to COCs via groundwater direct contact may warrant risk management. All other exposure scenarios do not warrant risk management.

To facilitate remedial action planning, aside from vapor intrusion, which will be managed separately following additional characterization/evaluation and eventually through pathway elimination, SSS for each of the COCs were developed. These SSS, if achieved in the Tank Group 07 area, would achieve acceptable risk/HI for each receptor exposure scenario under current and reasonably expected future land/groundwater use.

Notes:

Only constituents detected are shown.

The concentrations for the Xylene isomers (m/p and o) were summed before comparing to the criteria for Xylenes (total).

Ratios of concentration to the RBSLs greater than 1 are shaded in bold.

Chem Group - chemical group; INORG - metals; SVOC - semi-volatile organic compounds; VOC - volatile organic compounds

Table 4

Scenarios for Potential Human Exposure

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Receptor Population	Exposure Medium	Exposure Route	Potential Current Exposure?	Potential Future Exposure?	Comments
On-Site/Off-Site					
Routine Workers	surface soil	incidental ingestion of and dermal contact with surface soil	No	Yes	Currently, routine workers are not at the Site as the Facility is currently undergoing decommissioning, cleanup and redevelopment. Following redevelopment, exposure to surface soil through incidental ingestion, dermal contact, and inhalation of vapor and particulates is possible in areas without ground cover and in those areas where ground cover may be removed in the future. Following redevelopment, most of the soil at the Site will be located under building slabs, drive aisles, parking lots, new roadways, and other paved areas. Buildings in areas where potentially unacceptable vapor intrusion risks are identified will be managed via engineering controls (e.g., vapor barriers or other mitigation controls).
		inhalation of soil-derived vapors and airborne particulates (wind erosion) in outdoor air	No	Yes	
		inhalation of soil-derived vapors that migrate through building foundations into indoor air	No	Yes	
	subsurface soil	inhalation of soil-derived vapors in outdoor air	No	Yes	Following redevelopment, exposure to surface soil through incidental ingestion, dermal contact, and inhalation of vapor and particulates is possible in areas without ground cover and in those areas where ground cover may be removed in the future. Following redevelopment, most of the soil at the Site will be located under building slabs, drive aisles, parking lots, new roadways, and other paved areas. Buildings in areas where potentially unacceptable vapor intrusion risks are identified will be managed via engineering controls (e.g., vapor barriers or other mitigation controls).
		inhalation of soil-derived vapors that migrate through building foundations into indoor air	No	Yes	
	groundwater	incidental ingestion of and dermal contact with groundwater and inhalation of groundwater-derived vapors during use of groundwater for drinking water	No	No	Routine worker activities do not involve contact with groundwater. Groundwater is not currently used for potable purposes at the Site. Groundwater is not expected to be used for potable purposes in the future as the First Amendment to the Consent Order and Agreement restricts the use of groundwater at the Facility for any purpose except for sampling, treatment and/or other remedial activities, eliminating future potable or non-potable use.
		incidental ingestion of and dermal contact with groundwater and inhalation of groundwater-derived vapors during use of groundwater for purposes other than drinking water	No	No	
		inhalation of groundwater-derived vapors in outdoor air	No	Yes	Following redevelopment, exposure through inhalation of vapor is possible in areas without ground cover and in those areas where ground cover may be removed in the future. Buildings in areas where potentially unacceptable vapor intrusion risks are identified will be managed via engineering controls (e.g., vapor barriers or other mitigation controls).
		inhalation of groundwater-derived vapors that migrate through building foundations into indoor air	No	Yes	
	LNAPL	inhalation of vapors in outdoor air	No	Yes	Following redevelopment, exposure through inhalation of vapor is possible in areas without ground cover and in those areas where ground cover may be removed in the future. Buildings in areas where potentially unacceptable vapor intrusion risks are identified will be managed via engineering controls (e.g., vapor barriers or other mitigation controls).
inhalation of vapors that migrate through building foundations into indoor air		No	Yes		
Maintenance Workers	surface soil	incidental ingestion of and dermal contact with soil	No	Yes	Currently, maintenance workers are not at the Site as the Facility is currently undergoing decommissioning, cleanup and redevelopment.
		inhalation of soil-derived vapors and airborne particulates in work-space outdoor air	No	Yes	
	subsurface soil	incidental ingestion of and dermal contact with soil	No	Yes	Following redevelopment, maintenance workers could be exposed (1) to surface and subsurface soil during occasional excavations, or (2) to shallow groundwater or LNAPL during occasional excavations that encounter the water table, that are not covered by the health and safety protocols established by the Site health and safety program.
		inhalation of soil-derived vapors and airborne particulates in work-space outdoor air	No	Yes	
	groundwater	incidental ingestion of and dermal contact with exposed groundwater	No	Yes	
		inhalation of vapors from exposed groundwater in work-space outdoor air	No	Yes	
	LNAPL	dermal contact with exposed NAPL	No	Yes	
inhalation of vapors from exposed NAPL in work-space air		No	Yes		
Construction (Redevelopment) Workers	surface soil	incidental ingestion of and dermal contact with soil	Yes	Yes	
	subsurface soil	inhalation of soil-derived vapors and airborne particulates in work-space air	Yes	Yes	
	surface soil	incidental ingestion of and dermal contact with soil	Yes	Yes	
	subsurface soil	inhalation of soil-derived vapors and airborne particulates in work-space air	Yes	Yes	
	groundwater	incidental ingestion of and dermal contact with exposed groundwater	Yes	Yes	
		inhalation of vapors from exposed groundwater in work-space air	Yes	Yes	
	LNAPL	inhalation of vapors from exposed NAPL in work-space air	Yes	Yes	
		inhalation of vapors from exposed NAPL in work-space air	Yes	Yes	

Table 4

Scenarios for Potential Human Exposure

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Receptor Population	Exposure Medium	Exposure Route	Potential Current Exposure?	Potential Future Exposure?	Comments
On-Site/Off-Site (cont.)					
Trespassers	surface soil	incidental ingestion of and dermal contact with surface soil	Yes	Yes	Access to the Site is currently restricted by fencing and security measures. While limited, exposure to surface soil is possible in areas without ground cover, and in those areas where ground cover may be removed in the future. Following redevelopment, most of the soil at the Site will be located under building slabs, drive aisles, parking lots, new roadways, and other paved areas. Trespasser exposure to soil, groundwater, and LNAPL will be qualitatively evaluated by using routine worker exposure estimates as a surrogate.
		inhalation of soil-derived vapors and airborne particulates (wind erosion) in outdoor air	Yes	Yes	
	subsurface soil	inhalation of soil-derived vapors in outdoor air	Yes	Yes	
	groundwater	inhalation of groundwater-derived vapors in outdoor air	Yes	Yes	
	LNAPL	inhalation of vapors in outdoor air	Yes	Yes

1 Introduction

This appendix provides supplemental information supporting the human health risk assessment presented in Section 5 of the *Site-Specific Human Health Risk Assessment* (the Risk Assessment). The methods used in the human health risk assessment are based on Pennsylvania Department of Environmental Protection (PADEP) and the United States Environmental Protection Agency (USEPA) risk assessment guidance.

Section 5.3.1 of the Risk Assessment describes how cumulative cancer risks and noncancer hazardous Indexes (HIs) are calculated for each of the receptors potentially exposed to constituents of potential concerns (COPCs) at the Site. Several key elements of the risk assessment calculations are presented and discussed in the Risk Assessment and not repeated in this appendix. This includes the selection of COPCs (Section 3.1), the compilation of toxicity values (Section 5.2), the identification of receptors and scenarios for potential human exposure (Section 5.1.1), exposure factors used (Section 5.1.4), and the calculation of receptor specific exposure concentrations (Section 5.1.2).

This appendix provides additional details regarding how the risk calculations are performed for each receptor. This includes the fate and transport modeling needed to estimate exposure concentrations for specific receptors and specific exposure scenarios. The chemical properties used in these fate and transport modeling are provided in Attachment 1, Table 1.

The appendix is organized into sections corresponding to the following potentially exposed populations discussed in Section 5.1 of the Risk Assessment:

- Routine Workers
- Maintenance Workers
- Construction Workers

2 Risk Estimation Methodology

Section 5.3.1 of the Risk Assessment describes how cancer risk and noncancer HI are calculated for receptors potentially exposed to COPCs in soil and groundwater at the Site. The exposure factors used in the risk calculations and their bases are presented in Section 5.1.4 of the Risk Assessment and are not repeated herein.

The cancer risk associated with potential exposure to a carcinogenic constituent via ingestion and dermal contact is calculated by multiplying an estimate of the *LADD* for a particular exposure scenario by the cancer *SF* for the constituent as follows:

$$Risk = LADD \cdot SF$$

For the inhalation route, the cancer risk is calculated using the constituent concentration in air (C_{air}) and the URF, as follows:

$$Risk = URF \cdot C_{air} \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

Where ET is exposure time, EF is exposure frequency, ED is exposure duration, and AT_c is the averaging time for carcinogens.

The noncancer hazard quotient (HQ) associated with potential exposure via incidental ingestion and dermal contact was calculated by dividing an estimate of the ADD by the RfD for the constituent as follows:

$$HQ = \frac{ADD}{RfD}$$

For the inhalation route, the HQ was calculated using C_{air} and the RfC , as follows:

$$HQ = \frac{C_{air}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

In this risk assessment, unit cancer risks and unit HQs are calculated for a unit constituent concentration (C_{unit}). C_{unit} is 1 mg/kg for soil and 1 mg/L for groundwater. Because risk estimates scale directly with the constituent concentration (except for cancer risk estimates at very high doses), these unit risks and unit HQs can be calculated once and used to calculate cancer and noncancer risk estimates efficiently for a large number of locations by multiplying the constituent concentrations for each location by the unit risks and unit HQs. The unit risks and unit HQs for all routes of exposure (incidental ingestion, dermal contact, vapor inhalation, and/or particulate inhalation) for a given receptor to constituents in a given environmental medium are conservatively summed to produce a single unit risk and unit HQ for each constituent. The cancer risk and noncancer HQ for a particular constituent i at a particular location are calculated as follows:

$$Risk_i = \frac{C_i \cdot UnitRisk_i}{C_{unit}}$$

$$HQ_i = \frac{C_i \cdot UnitHQ_i}{C_{unit}}$$

The media-specific cumulative cancer risk and noncancer HI from exposure to the combination of COPC are estimated following USEPA (1989) guidance, as follows:

$$Cumulative\ Risk = \sum_i Risk_i$$

$$Hazard\ Index = \sum_i HQ_i$$

Where $Risk_i$ is the estimated cancer risk for the i^{th} constituent and HQ_i is the HQ for the i^{th} constituent. This approach may result in estimates of media-specific cumulative cancer risk and HI that are more

conservative than necessary. For example, different COPC may cause different and unrelated noncancer health effects, so summing the HQs for their individual effects would overestimate the significance of their combined effects. Nonetheless, this approach is used here as a conservative assessment tool.

Estimated media-specific cumulative cancer risks for each receptor population are compared to PADEP's risk management goals established in Section 250.402(b). Specifically, cumulative cancer risks are compared to an incremental increased cancer risk goal of 1×10^{-4} while noncancer HIs are compared to an HI of 1. For constituents with different and unrelated noncancer health effects, summing the HQs would overestimate the significance of their combined effects. When such a summation results in an HI that exceeds 1, the HQs may be segregated by target organ and/or critical health effects (USEPA 1989). Risk estimates equal to or below these goals represent levels which would not warrant risk management action.

The following sections discuss the calculation of unit risks/HQs for each receptor exposure scenario.

2.1 Routine Workers

The risk assessment evaluates nonresidential exposures to COPC via: (1) soil contact and inhalation during outdoor activities, (2) vapor intrusion from soil and groundwater, (3) volatilization into outdoor air from groundwater, and (4) nonpotable use of groundwater (discussed in Section 2.5).

2.1.1 Exposure to Soil During Outdoor Activities

Routine workers could be exposed to surface soil via incidental ingestion, dermal contact, and inhalation of vapors and particulates during outdoor activities. Risk estimates are calculated using unit risks and unit HQs as discussed above and in Section 5.3 of the Risk Assessment. The receptor specific calculations are discussed in this section.

Lifetime Average Daily Dose

The lifetime average daily doses for soil ingestion ($LADD_{ing}$) and soil dermal contact ($LADD_{derm}$) are calculated as follows, using the exposure factors for resident soil contact (Section 5.1.4 of the Risk Assessment):

$$LADD_{ing} = C_{soil} \cdot \frac{IR \cdot FC \cdot EF \cdot ED}{BW \cdot AT_c}$$

$$LADD_{derm} = C_{soil} \cdot \frac{SA \cdot AF \cdot ABS_{derm} \cdot FC \cdot EF \cdot ED}{BW \cdot AT_c}$$

where C_{soil} is the constituent concentration in soil, IR is the ingestion rate, FC is the fraction of the soil that is contaminated, SA is the exposed skin surface area, AF is the soil-to-skin adherence factor, and ABS_{derm} is the constituent-specific dermal absorption factor.

Average Daily Dose

The average daily doses for soil ingestion (ADD_{ing}) and soil dermal contact (ADD_{derm}) are calculated as follows:

$$ADD_{ing} = C_{soil} \cdot \frac{IR \cdot FC \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

$$ADD_{derm} = C_{soil} \cdot \frac{SA \cdot AF \cdot ABS_{derm} \cdot FC \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

Estimating Air Concentrations

For the inhalation route, the air concentrations of vapors and particulates from soil are calculated as follows:

$$C_{air} = J \cdot \frac{C}{Q}$$

where $J \cdot C/Q$ is an air concentration that is normalized to unit concentration in soil. The J term is the normalized average vapor (J_v) or particulate flux ($J_{10,w}$), and the C/Q term is the air concentration normalized to a unit flux (i.e., C/Q is an air dispersion factor).

The normalized average vapor flux J_v of a constituent from unsaturated soil is conservatively estimated using an unsteady-state model derived by Jury et al. (1983). This model conservatively assumes that volatile constituents are present in the soil to a finite depth equal to the approximate depth to groundwater at the Site of 16 ft bgs. The equation for J_v is given by:

$$J_v = \frac{C_0}{T} \left[Z_1 \operatorname{erfc} \left(\frac{Z_1}{2\sqrt{D_E T}} \right) + 2 \sqrt{\frac{D_E T}{\pi}} \left(1 - e^{-\frac{Z_1^2}{4D_E T}} \right) \right]$$

where,

$$D_E = \frac{D_G H + D_L}{\rho_b K_d + \theta_w + \theta_a H}$$

$$D_G = D_{air} \cdot \frac{\theta_a^{10/3}}{n^2}$$

$$D_L = D_{water} \cdot \frac{\theta_w^{10/3}}{n^2}$$

$C_{s,0}$ is the concentration in soil, ρ_b is the soil bulk density, T is the averaging period (equivalent to ED), H is the Henry's law constant, K_d is the equilibrium-partitioning coefficient, θ_w is the water-filled soil porosity, θ_a is the air-filled soil porosity, D_{air} is diffusion rate through air, D_{water} is the diffusion rate through water, and n is total porosity. For this risk assessment, Henry's law constants have been adjusted to reflect a specific subsurface temperature of 18°C, which is conservative (PADEP 2021).

Derivation of these equations and definition of the equation parameters can be found in the Jury et al. 1983 journal article and in USEPA guidance (1996a, 1996b), and therefore, are not repeated here. The calculation of J_v was performed using values for constituent-specific parameters and default soil parameters recommended in the USEPA guidance (2004a), using a soil type of sand, which is representative of the soil type found at the Site. The calculation of J_v is shown in Attachment 2, Table 1.

The normalized average particulate flux $J_{10,w}$ of a constituent from soil is conservatively estimated using the “unlimited reservoir” model that USEPA has adapted for screening-level analysis of particulate emissions from soil (USEPA 1996a, 1996b). This model assumes that particulate emissions are created by wind erosion. The equation for $J_{10,w}$ is given by:

$$J_{10,w} = 0.036 \cdot (1 - G) \cdot \left(\frac{u_m}{u_t}\right)^3 \cdot F(x) \frac{g}{m^2 hr} \cdot \frac{hr}{60^2 sec} \cdot \frac{10^{-3} kg}{g}$$

where G is fraction of ground/vegetative cover, u_m is the mean annual wind speed at the nearest weather station which is located in Philadelphia, Pennsylvania (NOAA 2018), u_t is the equivalent threshold wind speed at the anemometer height at which u_m was measured in Philadelphia, Pennsylvania, and $F(x)$ is a function dependent on u_m/u_t . The details of this model can be found in USEPA guidance (1996a, 1996b), and are not repeated here. The default parameter values recommended in the USEPA guidance (1996a, 1996b) are used with site-specific wind speed in calculating $J_{10,w}$. The calculation of $J_{10,w}$ is shown in Attachment 2, Table 2.

The C/Q term is estimated using the empirical correlation in USEPA’s *Supplemental Soil Screening Guidance* (2002), using the correlation coefficients for Philadelphia, Pennsylvania, and assuming a source area of 0.4 acre. This source area size is a conservative estimate of the area potentially impacted by the release. The calculation of C/Q is shown in Attachment 2, Table 3.

The unit risk and unit HQ calculations are shown in Attachment 2 of this appendix, and the computation of the upper-bound site-related single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7 of this appendix.

2.1.2 Vapor Intrusion

To evaluate potential future vapor intrusion exposures to soil and shallow groundwater in a hypothetical building, vapor intrusion risk estimates are developed using the following modeling approaches and input parameters discussed below.

2.1.2.1 Soil

For the vapor intrusion inhalation exposure pathway, estimates of cancer risk and noncancer HQ/HI are calculated using unit risks and unit HQs as discussed above and in Section 5.3 of the Risk Assessment.

Modeling Vapor Intrusion from Soil

For the indoor air exposure pathway, estimates of cancer risk and noncancer HQ are calculated as follows:

$$Risk = C_{building} \cdot URF \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

$$HQ = \frac{C_{building}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

where $C_{building}$ is the concentration in indoor air. For assessing routine worker exposures, chronic $RfCs$ are used. The indoor air concentration is estimated using the modeling approach and input parameter values discussed below.

The indoor air concentrations are estimated using the following relationships described by Johnson and Ettinger (1991):

$$C_{building} = \alpha \cdot C_{source}$$

where α is an attenuation coefficient and C_{source} is the source vapor concentration that is given by the following equation:

$$C_{source} = C_{soil} \left(\frac{K_d}{H} + \frac{\theta_w}{\rho_b H} + \frac{\theta_a}{\rho_b} \right)^{-1}$$

The attenuation coefficient, assuming that constituents are present in the soil at constant concentrations, is given by the following equation:

$$\alpha = \frac{\left[\frac{D_T^{eff} A_B}{Q_{building} L_T} \right] \exp \left(\frac{Q_{soil} L_{crack}}{D^{crack} A_{crack}} \right)}{\exp \left(\frac{Q_{soil} L_{crack}}{D^{crack} A_{crack}} \right) + \left[\frac{D_T^{eff} A_B}{Q_{building} L_T} \right] + \left[\frac{D_T^{eff} A_B}{Q_{soil} L_T} \right] \left[\exp \left(\frac{Q_{soil} L_{crack}}{D^{crack} A_{crack}} \right) - 1 \right]}$$

Derivation of this equation and definition of the equation parameters can be found in Johnson and Ettinger's 1991 journal article and therefore are not repeated here.

The effective diffusion coefficient term D_T^{eff} in the equation for the attenuation coefficient α is calculated using a soil-water profile that is estimated using a soil type of sand, which is representative of the soil type found at the Site. The soil-water profile in the vadose zone is estimated using the van Genuchten soil-water retention equation with default water retention parameters appropriate for sand (USEPA 2004a). It is conservatively assumed that the building cracks are filled with sand. These parameters and the resulting soil-water profile in the vadose zone are shown in Attachment 2 of this appendix.

The remaining parameters in the equation for the attenuation coefficient α , which relate to building characteristics, are conservatively based on the default values for a slab-on-grade nonresidential building with an air exchange rate of 0.60 per hour as recommended by PADEP (2021). The values used in the calculations are shown in Attachment 2 of this appendix and their bases are discussed in PADEP (2021) and USEPA (2004a) guidance.

Mass Limit Check

Indoor air concentrations from the soil vapor intrusion are calculated with a mass balance check. The mass balance check ensures that the assumed mass of a constituent infiltrating into the building over the assumed exposure period does not exceed an upper-bound estimate of the constituent's mass in the vadose zone underlying the building. The upper-bound estimate of the constituent's mass in the vadose zone is conservatively estimated using the highest concentration of the constituent from any depth at

each area and assuming this concentration represents the soil concentration from slab to the water table. The attenuation coefficient α_{ML} used in the mass balance check is given by the following equation:

$$\alpha_{ML} = \left(\frac{\rho_b K_d}{H} + \frac{\theta_w}{H} + \theta_a \right) \cdot \left(\frac{L_B \cdot W_B \cdot \Delta H}{Q_{building} \cdot ED} \right)$$

where L_B is the length of the building, W_B is the width of the building, ΔH is the contaminant thickness (conservatively assumed to be the distance between groundwater and a building foundation [L_{T-gw}]), and $Q_{building}$ is the air flow rate through the building. The depth to groundwater in the area of the Site is approximately 16 ft bgs. All parameters are shown in Attachment 2 of this appendix.

$Q_{building}$ is a function of the size of the building (or unit) and the amount of air exchanges that occur as a result of operating the air handling and ventilation system. It can be calculated as follows (USEPA 2004a, 2017b):

$$Q_{building} = L_B \cdot W_B \cdot H_B \cdot ER$$

where H_B is the occupied height of the building and ER is the air exchange rate.

For $Q_{building}$, the length (10 m), width (10 m), and height (2.44 m) of the generic nonresidential building are assumed, consistent with PADEP's recommended default assumptions for generic slab-on-grade nonresidential buildings (PADEP 2021). A conservative estimate of ER (i.e., 0.60/hr) was assumed based upon PADEP's (2021) recommended default for a generic nonresidential building.

The unit risk and unit HQ calculations are shown in Attachment 2 of this appendix, and the computation of the upper-bound site-related single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7 of this appendix.

2.1.2.2 Groundwater

For the vapor intrusion inhalation exposure pathway, estimates of cancer risk and noncancer HQ/HI are calculated using unit risks and unit HQs as discussed above and in Section 5.3 of the Risk Assessment.

Modeling Vapor Intrusion from Groundwater

The chemical-specific cancer risk and noncancer HQ estimates for exposure to COPC via vapor intrusion from groundwater are calculated in a manner analogous to the approach discussed in Section 2.1.2.1, except for the calculation of source vapor concentration.

The source vapor concentration for a chemical in groundwater is calculated from the chemical's concentration in groundwater C_{gw} using Henry's law as follows:

$$C_{source} = C_{gw} \cdot H$$

In calculating the attenuation coefficient α , the depth to groundwater was assumed to be 3 ft bgs below the basement slab. The calculation of α is shown in Attachment 2 of this appendix.

The unit risk and unit HQ calculations are shown in Attachment 2 of this appendix, and the computation of the upper-bound site-related single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7 of this appendix.

2.1.3 Volatilization to Outdoor Air

To evaluate potential exposure to COPC in outdoor vapors from shallow groundwater, risk estimates are developed using the following modeling approaches and input parameters discussed below.

2.1.3.1 Groundwater

The concentration (C_{air}) of groundwater chemicals that migrate through the vadose zone to outdoor air is calculated as follows:

$$C_{air} = J \cdot C/Q$$

where J is the vapor flux, and C/Q is the normalized, annual-average, air concentration at ground level (as discussed in Section 2.1.1).

The vapor flux J is calculated by using the steady-state diffusion equation in one-dimension with a constant source concentration and the maximum concentration gradient, as follows:

$$J = D_e \cdot \frac{C_v}{L}$$

where D_e is the effective diffusion coefficient of the chemical in the vapor phase, C_v is the vapor concentration in equilibrium with the groundwater concentration, and L is the distance from the water table to the ground surface. The equilibrium vapor concentration in the above equations is related to the groundwater concentration using Henry's law as discussed in Section 2.1.2.2.

The effective diffusion coefficient for the vapor phase is calculated in a manner analogous to the approach discussed in Section 2.1.2.2. The depth to water is assumed to be 3 ft bgs, the average depth to groundwater in Tank Group 07. The parameters used to calculate the effective diffusion coefficient are shown in Attachment 2 of this appendix.

The estimated outdoor air concentrations are used in the inhalation risk equations discussed in Section 2 to calculate single-chemical inhalation cancer risk and HQ. The unit risk and unit HQ calculations, and the computation of the upper-bound single-chemical cancer risk and HQ estimates, which were summed to estimate the cumulative cancer risk and HI, are shown in Attachment 7 of this appendix.

2.2 Maintenance Worker

Risk estimates for maintenance workers are calculated for potential exposures to soil and groundwater.

2.2.1 Exposure to Soil During Maintenance Activities

This human health risk assessment evaluates maintenance worker exposures to soil via incidental ingestion, soil contact, and inhalation during outdoor activities. The calculation of the risk estimates is analogous to those for routine workers except for (1) the use of soil exposure factors for maintenance workers and (2) the calculation of airborne vapor and dust concentrations which are described in this section.

The calculation of airborne vapor concentrations is analogous to those for routine workers except for the use of a shorter averaging period (T). For maintenance workers, an averaging period, T , of 10 years is used consistent with their exposure period. The calculation of J_v is shown in Attachment 3, Table 1.

As noted in Section 5.1.3.3 of the Risk Assessment, during maintenance activities the PM_{10} level is set at 50 micrograms per cubic meter ($\mu\text{g}/\text{m}^3$). This PM_{10} level is based on a time-weighted average assuming maintenance workers spend 1/3 of their exposure period excavating into the subsurface and 2/3 of their exposure period conducting maintenance activities that do not involve excavation into the subsurface. In calculating the time-weighted average, the 24-hour average National Ambient Air Quality Standards for PM_{10} of $150 \mu\text{g}/\text{m}^3$ is used as the PM_{10} concentration during excavations and a PM_{10} concentration of $1 \mu\text{g}/\text{m}^3$ is used for the time during maintenance activities that do not involve excavation. The PM_{10} concentration during non-excavation maintenance activities is expected to be less than $1 \mu\text{g}/\text{m}^3$, based on the wind erosion model recommended by USEPA (1996a) using site-specific wind speed from Philadelphia, Pennsylvania (NOAA 2018).

Attachment 3, Table 3 presents the air concentrations estimated for particulates and vapors.

The unit risk and unit HQ calculations are shown in Attachment 3. The upper-bound site-related single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7.

2.2.2 Exposure to Groundwater During Maintenance Activities

As discussed in Section 5.1.1 of the Risk Assessment, maintenance workers could be exposed to groundwater via incidental ingestion, dermal contact, and inhalation of vapors during excavations that extend into the water table. The cancer risk and noncancer HQ estimates for the ingestion and dermal exposure routes are calculated in a manner analogous to the method discussed in Section 2.1.1, except the exposure factors for maintenance worker contact with groundwater are used, as presented in Section 5.1.4 of the Risk Assessment, and the $LADD$ and ADD for the dermal route of exposure and the vapor flux are calculated as discussed below.

Lifetime Average Daily Dose

The $LADD$ for groundwater ingestion ($LADD_{ing}$) and groundwater dermal contact ($LADD_{derm}$) were calculated as follows:

$$LADD_{ing} = C_{gw} \frac{IR \cdot EF \cdot ED}{BW \cdot AT_c}$$

$$LADD_{derm} = C_{gw} \frac{DA_{event} \cdot SA \cdot EV \cdot EF \cdot ED}{BW \cdot AT_c}$$

where C_{gw} is the chemical concentration in groundwater (assumed to be a unit concentration of 1 mg/L), IR is the groundwater ingestion rate, DA_{event} is the absorbed dose per event, SA is the exposed skin surface area, and EV is the event frequency.

The DA_{event} for organic chemicals is estimated using an unsteady-state approach (USEPA 2004b, Equations 3.2 and 3.3), which is more conservative than the steady-state approach (USEPA 1989), particularly for hydrophobic chemicals. The DA_{event} for inorganic chemicals is estimated using a steady-state approach (USEPA 2004b, Equation 3.4). The details of the calculation of DA_{event} for organic and inorganic chemicals are provided by USEPA (2004b) and not repeated here.

Average Daily Dose

Average daily dose (ADD) for groundwater ingestion (ADD_{ing}) and groundwater dermal contact (ADD_{derm}) were calculated as follows:

$$ADD_{ing} = C_{gw} \frac{IR \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

$$ADD_{derm} = C_{gw} \frac{DA_{event} \cdot SA \cdot EV \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

Unit Cancer Risk, Unit Noncancer HQ, and RBSL for Groundwater Ingestion and Dermal Exposure Routes

For the groundwater ingestion and dermal exposure routes, the unit cancer risk and unit noncancer HQ were calculated as follows:

$$Unit\ Risk = LADD \cdot SF$$

$$Unit\ HQ = \frac{ADD}{RfD}$$

The unit risk and unit HQ calculations for each COPC for the groundwater ingestion and dermal exposure routes are presented in Attachment 3. The exposure factors used for maintenance workers are presented in Section 5.1.4. of the Risk Assessment.

Estimating Air Concentrations

For the inhalation route, the air concentrations (C_{air}) resulting from the volatilization of COCs from groundwater in an excavation were calculated as follows:

$$C_{air} = J \cdot C / Q$$

Where $J \cdot C/Q$ is an air concentration that is normalized to unit concentration (i.e., 1 mg/L) in groundwater. The J term is the normalized average vapor and the C/Q term is the air concentration normalized to a unit flux (i.e., C/Q is an air dispersion factor).

The normalized vapor flux J of a chemical from groundwater was estimated using an overall mass transfer coefficient that is recommended by USEPA (1995b):

$$J = \left(\frac{1}{k_l} + \frac{1}{Hk_g} \right)^{-1} \left(\frac{m}{10^2 cm} \right) \left(\frac{10^3 L}{m^3} \right)$$

Where k_l and k_g are the liquid-phase and gas-phase mass transfer coefficients given by the following:

$$k_l = \left(\frac{MW_o}{MW} \right)^{0.5} \left(\frac{T}{298K} \right) k_{l,o}$$

$$k_g = \left(\frac{MW_w}{MW} \right)^{0.335} \left(\frac{T}{298K} \right)^{1.005} k_{g,w}$$

Where MW , MW_o , and MW_w are the molecular weights of the chemical, oxygen, and water, respectively, T is the absolute temperature of the groundwater, $k_{l,o}$ is the liquid-phase mass transfer coefficient for oxygen (0.002 centimeters per second), and $k_{g,w}$ is the gas-phase mass transfer coefficient for water vapor (0.833 centimeters per second).

For groundwater exposures during excavations to the water table, C/Q is based on a source area of a 15-by 15-foot excavation area, and an averaging period of 24 hours. The maximum 24-hour average air concentration is estimated from the annual average air concentration by using a conservative factor of 0.4/0.19 or 2.1 (USEPA 2002).

Unit Cancer Risk, Unit Noncancer HQ, and RBSL for Inhalation Route

For the inhalation route, the inhalation cancer unit risk and noncancer unit HQ are calculated using the chemical concentration in air (C_{air}), as follows:

$$Unit Risk_{inh} = C_{air} \cdot URF \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

$$Unit HQ_{inh} = \frac{C_{air}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

The unit risk and unit HQ calculations for each COPC for the inhalation route are presented in Attachment 3. The exposure factors used for maintenance workers are presented in Section 5.1.4. of the Risk Assessment. The computation of the upper-bound single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the cumulative cancer risk and noncancer HI, are shown in Attachment 7 of this appendix.

2.3 Construction Worker

Risk estimates for construction workers are calculated for potential exposures to soil and groundwater.

2.3.1 Exposure to Soil During Construction Activities

This human health risk assessment evaluates construction worker exposures via incidental ingestion, soil contact, and inhalation during outdoor activities. The calculation of the risk estimates is analogous to those for routine workers except for (1) the use of soil exposure factors for construction workers and (2) the calculation of airborne vapor and dust concentrations which are described in this section.

The calculation of airborne vapor concentrations is analogous to those for residents except for the use of a shorter averaging period (T). For construction workers, an averaging period, T , of 1 year is used consistent with their exposure period. The calculation of J_v is shown in Attachment 4, Table 1.

As noted in Section 5.1.3.3 of the Risk Assessment, during construction activities the PM_{10} level is set at $50 \mu\text{g}/\text{m}^3$, which is the former annual average National Ambient Air Quality Standards for PM_{10} since construction workers are assumed to be performing excavations for a work year. It is conservatively assumed that the PM_{10} concentration would be at this limit every day for the entire period of construction worker exposure.

Attachment 4, Table 3 presents the air concentrations estimated for particulates and vapors.

The unit risk and unit HQ calculations are shown in Attachment 4. The upper-bound site-related single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7.

2.3.2 Exposure to Groundwater During Construction Activities

As discussed in Section 5.1.1 of the Risk Assessment, construction workers could be exposed to groundwater via incidental ingestion, dermal contact, and inhalation of vapors during excavations that extend into shallow groundwater. The computation of risk estimates for worker exposure to groundwater via incidental ingestion, dermal contact, and inhalation of vapors during construction activities is analogous to the computations discussed in Section 2.2.2 for maintenance workers, except the groundwater exposure factors for construction workers are used, as presented in Section 5.1.4. of the Risk Assessment, and subchronic noncancer toxicity values are used instead of chronic values since this exposure scenario represents a subchronic exposure.

The unit risk and unit HQ calculations are shown in Attachment 4. The upper-bound site-related single-chemical cancer risk and noncancer HQ estimates, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7.

2.4 Soil Migration-to-Groundwater

Cancer and noncancer risk estimates were calculated by scaling off of the soil migration-to-groundwater RBSLs. RBSLs developed to conservatively evaluate the potential for COPC in soil to leach to

groundwater at concentrations that may pose an unacceptable risk to human health or the environment are calculated using the methodologies described in the *Soil Screening Guidance: User's Guide* (USEPA 1996a).

RBSLs were calculated using both an “equilibrium partitioning” (also called soil/water partitioning [USEPA 1996a]) and a “leach test” methodology, as described below. For each COPC, the soil screening level corresponding to the more realistic of the two calculation methods is used as a soil migration-to-groundwater screening level. For COPC that are relatively immobile in the subsurface (e.g., semivolatile organic compounds), the equilibrium partitioning method provides a more realistic, yet conservative, soil leachate concentration because it assumes that the chemical concentration in soil remains constant over time (since the chemical is immobile, its concentration in soil does not significantly decrease over time). For chemicals that are relatively mobile (e.g., volatile organic compounds), the leach test method provides a more realistic, yet conservative, soil leachate concentration because it accounts for a finite amount of chemical mass in the soil. These two approaches of estimating soil leachate concentrations are conservative since they ignore attenuation of the chemical concentration in the vadose zone and dilution at the water table.

Equilibrium Partitioning

The soil/water partition equation, which assumes an infinite source of the chemical, can be used to estimate concentrations of chemicals in soil leachate for a given soil concentration.

$$C_{soil} = C_{pw} \left(K_d + \frac{\theta_w + \theta_a H}{\rho_b} \right)$$

In this relationship, C_{soil} is the soil concentration (mg/kg), C_{pw} is the soil leachate concentration (milligrams per liter [mg/L]), K_d is the chemical specific soil-water partition coefficient (liter per kilogram), θ_w is the water-filled soil porosity (unitless), θ_a is the air-filled soil porosity (unitless), H is the chemical-specific Henry's Law constant (unitless), and ρ_b is the dry soil bulk density (kilogram per liter [kg/L]). For organic chemicals, K_d is equal to the product of the chemical-specific soil organic carbon/water partition coefficient, K_{oc} (liter per kg), and the fraction organic carbon in soil, f_{oc} (unitless). For this analysis, the soil properties are based upon sand, the most conservative soil type identified at the Site. Specifically, θ_w is assumed to be 0.05 (liters per liter), θ_a is assumed to be 0.32 (liters per liter), and ρ_b is assumed to be 1.66 kg/L (USEPA 2004a).¹ The f_{oc} is assumed to be 0.005 (grams per gram) (USEPA 1996a). The chemical-specific K_d , and K_{oc} , and H (and their sources) used are presented in Attachment 5.

Leach Test Method

USEPA's leach test method (SW-846, Method 1312)² can be simulated by assuming a hypothetical worst-case leach test outcome in which the entire mass of the chemical in soil is extracted into the leaching

¹ Water-filled and air-filled porosity were estimated using the soil properties for sand (USEPA 2004) and the van Genuchten equation (van Genuchten 1980), assuming a depth to groundwater of 19 ft.

² Method 1312: Synthetic Precipitation Leaching Procedure, <https://www.epa.gov/sites/production/files/2015-12/documents/1312.pdf>.

fluid. With this assumption, the concentration of the COPC in soil can be divided by 20 (which is the ratio of the mass of leaching fluid to the mass of soil in the leaching test protocol) to estimate its leachate concentration as follows:

$$C_{soil} = C_{pw} \times \frac{mr_{fluid:solid}}{\rho_{fluid}}$$

In the relationship above, C_{soil} is the soil concentration (mg/kg), C_{pw} is the soil leachate concentration (mg/L), $mr_{fluid:solid}$ (kilogram per kilogram) is the mass ratio of the extraction fluid to soil used in the leach test (i.e., 20 kg fluid per 1 kg soil), and ρ_{fluid} (kg/L) is the density of the extraction fluid (assumed to be 1 kg/L).

Dilution Attenuation Factor and Calculation of Soil Migration to Groundwater Screening Levels

As soil leachate moves through soil and groundwater, chemical concentrations are attenuated. The reduction in concentrations can be expressed by a dilution attenuation factor (DAF) defined as a ratio of soil leachate concentration to receptor point concentration (USEPA 1996a).

Rather than independently model leachate migration to calculate a site-specific *DAF*, a generic *DAF* of 20 was conservatively used in the development of the RBSLs. This default *DAF* is recommended by USEPA (1996a) for contaminated soil sources up to 0.5 acres.

To calculate soil migration to groundwater screening levels, the equations presented above can be further refined as follows:

$$C_{soil-SPLP} = C_{pw} \times \frac{mr_{fluid:solid}}{\rho_{fluid}} \times DAF$$

$$C_{soil-Kd} = C_{pw} \left(K_d + \frac{\theta_w + \theta_a H}{\rho_b} \right) \times DAF$$

By substituting target groundwater concentrations for C_{pw} in the leach test method and equilibrium-partitioning method equations, and assuming a *DAF*, two possible soil screening levels are calculated. The higher of the two estimated values was used as the RBSL as the higher represents the more realistic, yet conservative, soil screening level for this pathway.

Soil migration-to-groundwater RBSLs were calculated using the target groundwater concentrations based on groundwater RBSLs for the following scenarios:

- Routine worker exposure to COPC in groundwater via volatilization to outdoor air and vapor intrusion
- Construction worker exposure to COPC in groundwater via direct contact
- Receptor exposure to COPC in groundwater via nonpotable groundwater use

The acceptable groundwater concentrations are presented in Attachment 5. The soil migration-to-groundwater screening levels are presented in Appendix B of the Risk Assessment.

2.5 Nonpotable Groundwater Use

Potential exposures to COPC in groundwater via nonpotable groundwater use are evaluated using a hypothetical scenario where groundwater is used to fill a backyard wading pool (“kiddie” pool). This scenario represents a reasonable worst case exposure scenario in which the estimated exposure is expected to be higher than those associated with other nonpotable uses (e.g., watering lawns, washing cars). Potential routes of exposure in this scenario include incidental ingestion, dermal contact, and inhalation of vapors.

Estimates of cancer risk and noncancer HQ/HI are calculated using unit risks and unit HQs as discussed above and in Section 5.3 of the Risk Assessment and using the exposure factors as presented in Section 5.1.4. of the Risk Assessment.

Water Concentration in Kiddie Pool

The model for estimating vapor emission from a residential kiddie pool is based on models for estimating vapor emissions from open-top batch tanks (USEPA 1995a, 1995b). The residential kiddie pool is modeled as a 6-ft diameter tank that is 9 inches deep and is assumed to be filled with groundwater once per day. The concentration of volatile organic chemicals in the kiddie pool water decreases over time as the chemicals volatilize into the air. The average concentration over a period t is given by:

$$\bar{C}_w = C_{w,o} \frac{d}{K \cdot t} (1 - e^{-Kt/d})$$

where $C_{w,o}$ is the initial concentration, d is the depth of water in the pool and K is the chemical’s overall mass transfer coefficient (USEPA 1995b). K is calculated as follows:

$$K = \frac{k_l \cdot H k_g}{k_l + H k_g}$$

where H is the Henry’s law constant, and k_l and k_g are the liquid-phase and gas-phase mass transfer coefficients given by the following equations (USEPA 1995a):

$$k_l = 10^{-6} + 144 \cdot 10^{-4} (0.01 u_{10} \sqrt{6.1 + 0.63 u_{10}})^{2.2} S_{c_l}^{-0.5}$$

$$k_g = 4.82 \cdot 10^{-3} u_{10}^{0.78} S_{c_g}^{-0.67} d_e^{-0.11}$$

where S_{c_l} and S_{c_g} are liquid-phase and gas-phase Schmidt numbers, d_e is the effective diameter of the water surface (m), and u_{10} is wind speed at 10 m above the water surface, which is 4.2 m/s based on the annual average wind speed in Philadelphia, Pennsylvania (NOAA 2018).

Air Concentration from Kiddie Pool

The concentration of the chemical in air at the water surface is given by the following:

$$C_{air} = \bar{C}_w \cdot K \cdot (C/Q)$$

The C/Q term is estimated using the empirical correlation in USEPA's *Supplemental Soil Screening Guidance* (2002), using the correlation coefficients for Philadelphia, Pennsylvania, and assuming a source area of a 6 by 6 foot kiddie pool. This air concentration is expected to be higher than actual air concentrations to which individuals would be exposed while in the kiddie pool.

Unit Cancer Risk, Unit Noncancer HQ, and RBSL

The unit risk and unit HQ calculations are shown in Attachment 6. The upper-bound site-related single-chemical cancer risk and noncancer HQ estimates for each sampling location, which are summed to estimate the media-specific cumulative cancer risk and noncancer HI, are shown in Attachment 7.

2.6 Groundwater Contaminant Transport

Where unacceptable risk via exposure to groundwater has been identified in Site Characterization samples collected from groundwater monitoring wells, a 2-dimensional fate and transport model was used to calculate the maximum potential downgradient extent of the unacceptable risk in groundwater. The PADEP's spreadsheet application of the analytical model developed by P.A. Domenico (Quick Domenico; QD) was used to conduct the evaluation. PADEP recommends the use of this as a screening model.

The QD spreadsheet application can conservatively calculate the concentration of a COPC at a point and time downgradient of source area of known size and strength. Given the conservative nature of this model, the results it generates represent the maximum estimated horizontal extent of a COPC in groundwater from an individual source area.

The QD model will be used to predict the potential downgradient extent of the unacceptable risk in groundwater in the future (i.e., 30 years) in the absence of risk management action. The input parameters and assumptions which will be used in this model have been determined in accordance with the *User's Manual for the Quick Domenico Groundwater Fate-and-Transport Model* (PADEP 2014).

Because the assumptions and input parameters used in this model represent conservative assumptions (e.g., steady-state source concentration, conservative generic parameter assumptions), the results of this screening model in this case will represent conservative high-end outcomes. For this reason, detailed calibration and sensitivity analyses are not warranted (i.e., such efforts would result in less conservative conclusions regarding the nature and extent of AST-related groundwater contamination). Despite this, a discussion of potential uncertainties in the modeling performed is included.

The model is used in combination with an evaluation of the COPCs driving the unacceptable risk and/or HI. The fate and transport of chemicals in groundwater that have no material contribution to unacceptable risk/HI are not evaluated.

The models presented are based on concentrations of benzene that drive unacceptable risks for the following scenarios:

- Resident Nonpotable Use of groundwater at wells TG07-MW-05 and TG07-MW-07
- Routine Worker Vapor Intrusion of groundwater at TG07-MW-07

- Maintenance Worker Groundwater Contact of groundwater at TG07-MW-07
- Construction Worker Groundwater Contact of groundwater at TG07-MW-07
- Resident Nonpotable Use of groundwater at TG07-MW-07

Additionally, models were developed to evaluate groundwater concentrations exceeding the groundwater MtSW RBSL, which represents an assessment of the potential of ecological impacts to surface water of the Schuylkill River.

Source Concentration

The QD model assumes a uniform, constant aqueous phase source concentration and is not assumed to decay with time. Source concentrations used in these models include:

Monitoring Well	COPC	Source Concentration
TG07-MW-05	Benzene	11 mg/L
	Cumene	7.2 mg/L
TG07-MW-07	Benzene	240 mg/L
	Cumene	5.3 mg/L

Dispersivities

The longitudinal dispersivity (α_x) has been estimated using the following relationship:

$$\alpha_x = 0.1x$$

Where, x is the distance from the source well to the property boundary (i.e., conservatively assumed to be the nearest receptor point). The downgradient distance between the monitoring wells and the Schuylkill River (i.e., x) has been measured to be approximately 1,000 feet.

The transverse dispersivity (α_y) is estimated using the following relationship:

$$\alpha_y = 0.1\alpha_x$$

The vertical dispersivity (α_z) is conservatively estimated as 0.001 ft.

Decay Constant

First-order transport decay rates (λ) for each COPC are equal to the chemical-specific values provided in Ch. 250, Appendix A, Table 5A (PADEP 2021).

Source Width

The source width for groundwater contamination was inferred based upon the width of the specific source area (i.e., aerial extent of soil posing unacceptable risk for migration to groundwater) in the vicinity of each well, measured perpendicular the groundwater flow direction. For models evaluating groundwater concentrations exceeding the groundwater MtSW RBSL, a similar, COPC-specific source

width (i.e., aerial extent of soil concentrations exceeding the Migration to Groundwater RBSL) has been measured.

Monitoring Well	Assessment	COPC	Source Width
TG07-MW-05	Unacceptable Risk/HI	Benzene	50 ft
	> GW MtSW RBSL	Cumene	100 ft
TG07-MW-07	Unacceptable Risk/HI	Benzene	80 ft
	> GW MtSW RBSL	Benzene	85 ft
		Cumene	100 ft

Source Thickness

A source thickness of 30 ft has been used. This is the upper end of the range of the saturated thickness of the unconfined aquifer in AOI 6 as noted in the *Remedial Investigation Report, AOI 6* (AOI 6 RIR; GHD 2017).

Time

The modeling conservatively assumes that the source concentration will not change with time (i.e., steady-state). For this parameter, t , a 30-year (i.e., 11,000 days) time period assumption has been used.

Hydraulic Conductivity

For Tank Group 07, a hydraulic conductivity, K_h , of 12.1 ft/day has been used. This is the upper end of the estimated range of K_h in the unconfined aquifer in nearby Evergreen monitoring wells as noted in the AOI 6 RIR (GHD 2017).

Hydraulic Gradient

The hydraulic gradient, i , is estimated to be 0.00244 using the groundwater elevations measured prior to groundwater sampling.

Effective Porosity

The effective porosity, n_e , is assumed to equal 0.3. This is PADEP's (2014) recommended default for porous media.

Bulk Density

The bulk density, ρ_b , for the aquifer is assumed to be 1.7 g/cm³. This is PADEP's (2014) recommended default for QD modeling in unconsolidated materials.

Organic Carbon Partition Coefficient

Chemical-specific organic carbon partition coefficients, K_{oc} , are equal to the values provided in Ch. 250, Appendix A, Table 5A (PADEP 2021).

Fraction of Organic Carbon

The fraction of organic carbon, f_{oc} , is assumed to equal 0.002. This is PADEP's (2014) recommended default for QD modeling.

Target Concentrations

The target concentrations for each model are:

The results of the QD modeling are depicted in **Figure 7 of the Risk Assessment** and **Attachment 8**.

Monitoring Well	COPC	Unacceptable Risk/Hi				> RBSL
		R. Worker VI	Maint. Worker GW Contact	Const. Worker GW Contact	Nonpotable Use	GW MtSW
		Exposure Concentration (mg/L)				
TG07-MW-05	Benzene	-	-	-	2.9	-
	Cumene	-	-	-	-	3.0
TG07-MW-07	Benzene	36	11	35	2.7	130
	Cumene	-	-	-	-	3.0

Notes:

- 5 Based on potency relative to Benzo(a)pyrene [CASRN 50-32-8], as described in the indicated reference.
- 20 Terraphase used Pyrene [CASRN 129-00-0] value from the indicated reference as a surrogate.
- 62 Terraphase used chronic value as a surrogate for the subchronic value.
- 68 IRIS provides a range of 1.5E-2 to 5.5E-2 (mg/kg/d)-1 as the oral Slope Factor for Benzene.
- 90 Inadequate data exist to derive a toxicity value, according to the indicated reference.
- 104 Dermal toxicity value is extrapolated from oral toxicity value in accordance with the referenced USEPA guidance.
- 110 The value is based on discussion in the indicated reference regarding the principal study USEPA used in extrapolating from subchronic to chronic.
- 111 Value as published is an MRL in the indicated reference.
- 116 Terraphase used subchronic value as a surrogate for the chronic value.
- 159 Because the chemical has a mutagenic mode of action according to USEPA, the SF and URF are adjusted by the following age-dependent adjustment factors (ADAFs) before use: 10 for ages 0 to 2; 3 for ages 2 to 16; and 1 for ages 16 and older (USEPA 2005).
- 210 Terraphase used Triethylene glycol [CASRN 112-27-6] value from the indicated reference as a surrogate.
This extract was prepared on 1/9/2023.

Notes:

- 48 Not Available or Not Applicable
- 82 Used Equation (70) from Reference 44 to calculate Koc value using Log Kow value from indicated reference.
- 111 Used Equation (71) from Reference 44 to calculate Koc value using Log Kow value from indicated reference.
- 114 A value of 1 is conservatively used because EPA guidance does not provide a default value.
- 115 Calculated Kp value using equation 3.8 (p.3-7) in reference 62 with log Kow from the indicated reference and the MW presented in table.
- 117 Derived the FA based on Exhibit A-4 in the indicated reference.
- 123 Value has been assigned a default reference temperature.
- 125 Used Triethylene glycol [CASRN 112-27-6] value from the indicated reference as a surrogate.

Attachment 2

Table 1

Normalized Average Vapor Flux from Soil to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Soil bulk density	kg/L	ρ_b	1.66
Soil porosity	L/L-soil	θ	0.38
Soil water content	L/L-soil	θ_w	0.08
Soil air-filled porosity	L/L-soil	θ_a	0.30
Soil organic carbon fraction	unitless	f_{oc}	0.005
Averaging period (Exposure Duration)	years	T	25
	days	T	9125
Temperature	$^{\circ}\text{C}$	Temp	18
Clean soil above source	m	Z_1	
Bottom of source depth	m	Z_2	0.91

Based on the volatilization model developed by Jury et. al. (1983) for finite sources as described in USEPA's (1996) Soil Screening Guidance: Technical Background Document. The K_d for organic compounds is the K_{oc} times the f_{oc} .

Attachment 2

Table 2

Soil PM₁₀ Emission from Wind Erosion

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Unlimited Reservoir Model

Parameter	Units	Variable	Value
Aerodynamic particle size multiplier			0.036
Ground cover fraction		G	0.5
Mode of aggregate size distribution	mm		0.50
Threshold friction velocity	m/s	u'_t	0.50
Correction factor			1.25
Corrected friction velocity	m/s	u*_t	0.6252
Roughness height	m	z₀	0.005
Anemometer height	m		8.0
Friction velocity at anemometer height	m/s	u_t	11.53
Mean annual wind speed	mph	u_m	9.3
Mean annual wind speed	m/s	u_m	4.16
u_m/u_t			0.361
$x = 0.886 u_t/u_m$			2.46
F(x)			0.064
Annual average PM₁₀ flux	kg-soil/m²-s	J_{10,w}	1.5E-11

Model described in more detail in USEPA's (1996) *Soil Screening Guidance: Technical Background Document*.

Attachment 2

Table 3

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Soil source area	acres	20.6
		Annual
Soil C/Q averaging time		Max
Conversion factor from 1-Hr Max for soil		0.19
C/Q for soil	(kg/m³)/(kg/m²-s)	21.04

Groundwater source area	acres	20.6000
		Annual
Groundwater averaging time for C/Q		Max
Conversion factor from 1-Hr Max for groundwater		0.19
C/Q for Groundwater	(L/m³)/(L/m²-s)	21.04

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Normalized Indoor Air Concentration in a Default PADEP Nonresidential Building (Slab-On-Grade) Due to Vapor Intrusion from Soil

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes: Subsurface and Building Characteristics			Crack Soil
SCS Soil texture class			Sand
Bulk density	kg/L	ρ_b	1.66
Total porosity	L/L-soil	θ_T	0.375
Water-filled porosity	L/L-soil	θ_w	0.090
Air-filled porosity	L/L-soil	θ_a	0.285
Organic carbon fraction	unitless	f_{OC}	NA
Residual saturation	L/L-soil	θ_r	0.053
Hydraulic conductivity	cm/s	K	7.4E-03
Dynamic viscosity of water	g/cm-s	μ_w	0.01307
Density of water	g/cm ³	ρ_w	1.0
Gravitational acceleration	cm/s ²	g	980.7
Intrinsic permeability	cm ²	k	9.9E-08
Relative saturation	unitless	S_e	0.115
van Genuchten N	unitless	N	3.18
van Genuchten M	unitless	M	0.685
Relative air permeability	unitless	k_{rg}	0.887
Permeability to vapor	cm ²	k_v	8.8E-08
Distance from building foundation to source	m	L_{T-soil}	0.001
Bldg foundation thickness	m	L_{crack}	0.1
Bldg foundation length	m		10.00
Bldg foundation width	m		10.00
Bldg occupied height	m		2.44
Bldg occupied volume	m ³		244.00
Occupied depth below ground	m		0.2
Bldg area for vapor intrusion	m ²	A_B	106.0
Ratio of A_{crack} to A_B		η	4E-04
Area of cracks	m ²	A_{crack}	4.00E-02
Air exchange rate	hour ⁻¹	ach	0.6
Building ventilation rate	m ³ /day	Q_{bldg}	3.51E+03
Pressure difference between outdoors-indoors	kg/m-s ²	ΔP	1.0
Viscosity of air	kg/m-s	μ_a	1.8E-05
Crack length (bldg perimeter)	m	X_{crack}	40
Crack depth below ground	m	Z_{crack}	0.25
Crack radius	m	r_{crack}	1E-03
Soil gas flow rate into bldg	m ³ /day	Q_{soil}	7.20E+00
Averaging period	d	ED	9.13E+03
Contaminant thickness	m	ΔH	0.7

Normalized Indoor Air Concentration in a Default PADEP Nonresidential Building (Slab-On-Grade) Due to Vapor Intrusion from Groundwater

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Subsurface and Building Characteristics			Crack Soil
SCS Soil texture class			Sand
Bulk density	kg/L	ρ_b	1.66
Total porosity	L/L-soil	θ_T	0.375
Water-filled porosity	L/L-soil	θ_w	0.090
Air-filled porosity	L/L-soil	θ_a	0.285
Residual saturation	L/L-soil	θ_r	0.053
Hydraulic conductivity	cm/s	K	7.4E-03
Dynamic viscosity of water	g/cm-s	μ_w	0.01307
Density of water	g/cm ³	ρ_w	1.0
Gravitational acceleration	cm/s ²	g	980.7
Intrinsic permeability	cm ²	k	9.9E-08
Relative saturation	unitless	S_e	0.115
van Genuchten N	unitless	N	3.177
van Genuchten M	unitless	M	0.685
Relative air permeability	unitless	k_{rg}	0.887
Permeability to vapor	cm ²	k_v	8.79E-08
Distance from foundation to source	m	L_{T-gw}	0.66
Bldg foundation thickness	m	L_{crack}	0.1
Bldg foundation length	m		10.00
Bldg foundation width	m		10.00
Bldg occupied height	m		2.44
Bldg occupied volume	m ³		244.00
Occupied depth below ground	m		0.2
Bldg area for vapor intrusion	m ²	A_B	106.0
Ratio of A_{crack} to A_B		η	4E-04
Area of cracks	m ²	A_{crack}	4E-02
Air exchange rate	hour ⁻¹	ach	0.60
Building ventilation rate	m ³ /day	Q_{bldg}	3.5E+03
Pressure diff. outdoors-indoors	kg/m-s ²	ΔP	1.0
Viscosity of air	kg/m-s	μ_a	1.8E-05
Crack length (bldg perimeter)	m	X_{crack}	40
Crack depth below ground	m	Z_{crack}	0.25
Crack radius	m	r_{crack}	1E-03
Soil gas flow rate into bldg	m ³ /day	Q_{soil}	7.20

Table 1

Normalized Average Vapor Flux from Soil to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Soil bulk density	kg/L	ρ_b	1.66
Soil porosity	L/L-soil	θ	0.38
Soil water content	L/L-soil	θ_w	0.08
Soil air-filled porosity	L/L-soil	θ_a	0.30
Soil organic carbon fraction	unitless	f_{oc}	0.005
Averaging period (Exposure Duration)	years	T	10
	days	T	3650
Temperature	$^{\circ}\text{C}$	Temp	18
Clean soil above source	m	Z_1	
Bottom of source depth	m	Z_2	0.91

Based on the volatilization model developed by Jury et. al. (1983) for finite sources as described in USEPA's (1996) Soil Screening Guidance: Technical Background Document. The K_d for organic compounds is the K_{oc} times the f_{oc} .

Attachment 3

Table 2

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Soil source area	acres	20.6
		Annual
Soil C/Q averaging time		Max
Conversion factor from 1-Hr Max for soil		0.19
C/Q for soil	(kg/m³)/(kg/m²-s)	21.04

Groundwater source area	acres	0.0052
		24-Hour
Groundwater averaging time for C/Q		Max
Conversion factor from 1-Hr Max for groundwater		0.40
C/Q for Groundwater	(L/m³)/(L/m²-s)	9.63

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Notes:

Event Time hours t 2

K_p capped at 1 cm/hr (USEPA 1992).

The dermal absorbed dose for inorganic chemicals is estimated using a steady-state approach (USEPA 2004, Equation 3.4) and for organic chemicals is estimated using a nonsteady-state approach (USEPA 2004, Equations 3.2 and 3.3).

Table 1

Normalized Average Vapor Flux from Soil to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Soil bulk density	kg/L	ρ_b	1.66
Soil porosity	L/L-soil	θ	0.38
Soil water content	L/L-soil	θ_w	0.08
Soil air-filled porosity	L/L-soil	θ_a	0.30
Soil organic carbon fraction	unitless	f_{oc}	0.005
Averaging period (Exposure Duration)	years	T	1
	days	T	365
Temperature	°C	Temp	18
Clean soil above source	m	Z_1	
Bottom of source depth	m	Z_2	0.91

Based on the volatilization model developed by Jury et. al. (1983) for finite sources as described in USEPA's (1996) Soil Screening Guidance: Technical Background Document. The K_d for organic compounds is the K_{oc} times the f_{oc} .

Attachment 4

Table 2

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Soil source area	acres	20.6
		Annual
Soil C/Q averaging time		Max
Conversion factor from 1-Hr Max for soil		0.19
C/Q for soil	(kg/m³)/(kg/m²-s)	21.04

Groundwater source area	acres	0.0052
		24-Hour
Groundwater averaging time for C/Q		Max
Conversion factor from 1-Hr Max for groundwater		0.40
C/Q for Groundwater	(L/m³)/(L/m²-s)	9.63

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Table 2

Soil Migration to Groundwater Criteria Based on the Nonpotable GW Use RBSL [Cancer]

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

f_{oc}	Fraction organic carbon	0.005
ρ_b	Soil bulk density	1.66
n	Total porosity	0.38
θ_w	Water-filled soil porosity	0.08
θ_a	Air-filled soil porosity	0.30
DAF	Dilution attenuation factor	20

Only chemicals detected in soil are shown.

$C_{soil-MtGW-Eq}$: Soil screening level based on equilibrium partitioning (EQ)

$C_{soil-MtGW-Lt}$: Soil screening level based on simulated worst-case leach test (LT)

NA: Not applicable - target groundwater concentration times DAF is greater than constituent's solubility.

The K_d for organic compounds is the K_{oc} times the f_{oc} .

Table 5

Soil Migration to Groundwater Criteria Based on the RW GW Vol to Outdoor Air RBSL [Noncancer]

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

f_{oc}	Fraction organic carbon	0.005
ρ_b	Soil bulk density	1.66
n	Total porosity	0.38
θ_w	Water-filled soil porosity	0.08
θ_a	Air-filled soil porosity	0.30
DAF	Dilution attenuation factor	20

Only chemicals detected in soil are shown.

$C_{soil-MtGW-Eq}$: Soil screening level based on equilibrium partitioning (EQ)

$C_{soil-MtGW-Lt}$: Soil screening level based on simulated worst-case leach test (LT)

NA: Not applicable - target groundwater concentration times DAF is greater than constituent's solubility.

The K_d for organic compounds is the K_{oc} times the f_{oc} .

Table 10

Soil Migration to Groundwater Criteria Based on the GW MtSW RBSL

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

f_{oc}	Fraction organic carbon	0.005
ρ_b	Soil bulk density	1.66
n	Total porosity	0.38
θ_w	Water-filled soil porosity	0.08
θ_a	Air-filled soil porosity	0.30
DAF	Dilution attenuation factor	20

Only chemicals detected in soil are shown.

$C_{soil-MtGW-Eq}$: Soil screening level based on equilibrium partitioning (EQ)

$C_{soil-MtGW-Lt}$: Soil screening level based on simulated worst-case leach test (LT)

NA: Not applicable - target groundwater concentration times DAF is greater than constituent's solubility.

The K_d for organic compounds is the K_{oc} times the f_{oc} .

Notes:

Event Time hours t 2

K_p capped at 1 cm/hr (USEPA 1992).

The dermal absorbed dose for inorganic chemicals is estimated using a steady-state approach (USEPA 2004, Equation 3.4) and for organic chemicals is estimated using a nonsteady-state approach (USEPA 2004, Equations 3.2 and 3.3).

Attachment 6

Table 3

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Source area	acres	0.0008
Groundwater averaging time for C/Q		1-Hour Max
C/Q	(L/m³)/(L/m²-s)	15.83

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Notes:

Only constituents detected in each area are shown.

Single-chemical cancer risk and hazard quotient (HQ) estimates in excess of PADEP's thresholds for cumulative cancer risk and HI of 1E-4 and 1, respectively, are shaded and bold

Single-chemical cancer risk and HQ estimates in excess of 1/10 PADEP's thresholds for cumulative cancer risk or HI of 1E-4 and 1, respectively, are italic and bold

Where a chemical is non-detected at a location but detected within the media at the Site, half of the analytical limit is used as the exposure concentration

NC - Risk and HQ estimates were not calculated for detected chemicals with inadequate toxicity or physical/chemical parameters or where chemical concentrations were non-detect

The concentrations for the Xylene isomers (m/p and o) were summed to Xylenes (total).

Chem Group - chemical group

1 Introduction

Terraphase Engineering, Inc. (Terraphase), on behalf of Philadelphia Energy Solutions Refining and Marketing LLC (PESRM), has prepared this appendix to document the calculation of site-specific risk-based screening levels (RBSLs) for soil and groundwater. The RBSLs have been developed to support investigation decision-making at the Facility and determine the adequacy of data collected to support site-specific risk assessments which will be performed to close out areas of the Facility which are subject to various investigation/remedial action as part of redevelopment. This includes efforts to complete Site Assessment and Characterization for aboveground storage tanks under Act 32, efforts to investigate and obtain liability protection for several areas with suspected releases to the environment in accordance with Act 2, and efforts to investigate and attain closure of hazardous waste units in accordance with the Code of Federal Regulations Title 40, Part 264 Subpart G (as incorporated by reference in 25 Pa. Code Chapter 264a).

The RBSLs are developed with consideration for current and reasonably expected future land and groundwater use at and in the immediate vicinity of the Facility and use methods and assumptions consistent with Pennsylvania Department of Environmental Protection (PADEP) and United States Environmental Protection Agency (USEPA) risk assessment guidance.

RBSLs are developed for the following exposure scenarios:

Soil Exposure

- Routine worker exposure to constituents of potential concern (COPC) in soil via direct contact¹ and vapor intrusion
- Construction worker exposure to COPC in soil via direct contact
- Migration of COPC in soil to groundwater²

Groundwater Exposure

- Routine worker exposure to COPC in groundwater via volatilization to outdoor air and vapor intrusion
- Construction worker exposure to COPC in groundwater via direct contact
- Off-site resident exposure to COPC in groundwater via vapor intrusion
- Receptor exposure to COPC in groundwater via nonpotable groundwater use
- Migration of COPC in groundwater to surface water

¹ Includes incidental ingestion and dermal contact with COPCs in soil and inhalation of COPCs in soil-derived vapor and particulates.

² Uses groundwater RBSLs as target groundwater concentrations.

RBSLs are calculated for each of the COPC that have been (or will be) included in the soil and groundwater sampling performed by PESRM. A list of these COPC is provided in Attachment 1, Table 1.

The general assumptions used in the calculation of the human health-based RBSLs are summarized in Attachment 1, Table 2. The exposure factors for each receptor and exposure scenario are presented in Attachment 1, Table 3. Human health-based RBSLs are calculated at a target cancer risk level of 1×10^{-5} and a target noncancer hazard quotient of 0.1 and are presented in Attachment 1, Table 4. The target cancer risk level and target noncancer hazard quotient are used with consideration for the risk management goals established in Section 250.402(b) for attainment of the Site-Specific Standard (i.e., a cumulative excess cancer risk greater than 1×10^{-4} and a noncancer hazard index greater than 1³).

For efficiency, the RBSLs are developed in a manner that allows them to be used site-wide to complete Site Characterization at each area (e.g., Tank Group).

2 Risk-Based Screening Levels for Soil

This section details how RBSLs for soil are calculated accounting for routine worker (Section 2.1) and construction worker (Section 2.2) exposure scenarios. RBSLs which consider potential soil migration-to-groundwater assuming site-specific target groundwater concentrations are detailed in Section 2.3. The calculation of an RBSL for lead is summarized in Section 2.4.

The resulting RBSLs are presented in Attachment 1, Table 4.

2.1 Routine Workers

The RBSLs were calculated to evaluate commercial/industrial worker exposures to COPC in soil via: (1) direct contact and inhalation during outdoor activities and (2) vapor intrusion.

2.1.1 Exposure to Soil During Outdoor Activities

RBSLs for routine worker exposure to COPC in soil via incidental ingestion, dermal contact, and inhalation of particulates and vapors were estimated from unit risks and unit HQs as described below.

Lifetime Average Daily Dose

The lifetime average daily doses for soil ingestion ($LADD_{ing}$) and soil dermal contact ($LADD_{derm}$) are calculated as follows:

$$LADD_{ing} = C_{soil} \cdot \frac{IR \cdot FC \cdot EF \cdot ED}{BW \cdot AT_c}$$

$$LADD_{derm} = C_{soil} \cdot \frac{SA \cdot AF \cdot ABS_{derm} \cdot FC \cdot EF \cdot ED}{BW \cdot AT_c}$$

³ As estimated from exposure to COPC with the same target organ or target effect.

where C_{soil} is the chemical concentration in soil, IR is the ingestion rate, FC is the fraction of the soil that is contaminated, SA is the exposed skin surface area, AF is the soil-to-skin adherence factor, and ABS_{derm} is the chemical-specific dermal absorption factor.

Average Daily Dose

The average daily doses for soil ingestion (ADD_{ing}) and soil dermal contact (ADD_{derm}) are calculated as follows:

$$ADD_{ing} = C_{soil} \cdot \frac{IR \cdot FC \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

$$ADD_{derm} = C_{soil} \cdot \frac{SA \cdot AF \cdot ABS_{derm} \cdot FC \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

Unit Cancer Risk, Unit Noncancer HQ, and RBSL for Soil Ingestion and Dermal Exposure Routes

For the soil ingestion and dermal exposure routes, the unit cancer risk and unit noncancer HQ are calculated as follows:

$$Unit\ Risk = LADD \cdot SF$$

$$Unit\ HQ = \frac{ADD}{RfD}$$

The resulting RBSLs for each route (i) were calculated as follows:

$$Cancer\ RBSL_i = \frac{C_{unit} \cdot TCRL}{UnitRisk_i}$$

$$Noncancer\ RBSL_i = \frac{C_{unit} \cdot THQ}{UnitHQ_i}$$

The RBSLs for each route (i) are conservatively combined to give cancer and noncancer-based RBSLs that are based upon the combined receptor-specific exposure:

$$RBSL = \left(\sum_i RBSL_i^{-1} \right)^{-1}$$

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the soil ingestion and dermal exposure routes are presented in Attachment 2. The exposure factors used for routine workers are presented in Attachment 1, Table 3. The RBSLs for routine worker exposure to soil are provided in Attachment 1, Table 4.

Estimating Air Concentrations

For the inhalation route, the air concentrations (C_{air}) of vapors and particulates from soil are calculated as follows:

$$C_{air} = J \cdot \frac{C}{Q}$$

where $J \cdot C/Q$ is an air concentration that is normalized to unit concentration (i.e., 1 milligram per kilogram [mg/kg]) in soil. The J term is the normalized average vapor (J_v) or particulate flux ($J_{10,w}$), and the C/Q term is the air concentration normalized to a unit flux (i.e., C/Q is an air dispersion factor).

The normalized average vapor flux J_v of a chemical from unsaturated soil is conservatively estimated using an unsteady-state model derived by Jury et al. (1983). This model conservatively assumes that volatile chemicals are present in the soil to a finite depth equal to the approximate depth to groundwater at the Facility of 19 feet (ft) below ground surface (bgs)⁴. The equation for J_v is given by:

$$J_v = \frac{C_0}{T} \left[Z_1 \operatorname{erfc} \left(\frac{Z_1}{2\sqrt{D_E T}} \right) + 2 \sqrt{\frac{D_E T}{\pi}} \left(1 - e^{-\frac{Z_1^2}{4D_E T}} \right) \right]$$

where,

$$D_E = \frac{D_G H + D_L}{\rho_b K_d + \theta_w + \theta_a H}$$

$$D_G = D_{air} \cdot \frac{\theta_a^{10/3}}{n^2}$$

$$D_L = D_{water} \cdot \frac{\theta_w^{10/3}}{n^2}$$

$C_{s,0}$ is the concentration in soil, ρ_b is the soil bulk density, T is the averaging period (equivalent to ED), H is the Henry's law constant, K_d is the equilibrium-partitioning coefficient, θ_w is the water-filled soil porosity, θ_a is the air-filled soil porosity, D_{air} is diffusion rate through air, D_{water} is the diffusion rate through water, and n is total porosity. For this risk assessment, Henry's law constants have been adjusted to reflect a specific subsurface temperature of 18°C (PADEP 2021).

Derivation of these equations and definition of the equation parameters can be found in the Jury et al. 1983 journal article and in USEPA guidance (1996a, 1996b), and therefore, are not repeated here. The calculation of J_v was performed using values for chemical-specific parameters and default soil parameters recommended in the USEPA guidance (2004a) using a soil type of sand, which is

⁴ Depth to groundwater varies across the Facility. 19 ft bgs is the average depth to groundwater in Tanks Groups 02, 03, 04, and 05. The average depth to groundwater in Tank Group 01 is 10 ft bgs. The average depth to groundwater in Tank Groups 06, 07, and 08 is 3 ft bgs. Using a depth to groundwater of 19 ft bgs results in the most conservative RBSLs for this exposure route in comparison to using groundwater depths observed at other areas of the Facility.

representative of the soil type found at the Facility. The calculation of J_v is shown in Attachment 2, Table 1.

The normalized average particulate flux $J_{10,w}$ of a chemical from soil is conservatively estimated using the “unlimited reservoir” model that USEPA has adapted for screening-level analysis of particulate emissions from soil (USEPA 1996a, 1996b). This model assumes that particulate emissions are created by wind erosion. The equation for $J_{10,w}$ is given by:

$$J_{10,w} = 0.036 \cdot (1 - G) \cdot \left(\frac{u_m}{u_t}\right)^3 \cdot F(x) \frac{g}{m^2 hr} \cdot \frac{hr}{60^2 sec} \cdot \frac{10^{-3} kg}{g}$$

where G is fraction of ground/vegetative cover, u_m is the mean annual wind speed at the nearest weather station which is located in Philadelphia, Pennsylvania (NOAA 2018), u_t is the equivalent threshold wind speed at the anemometer height at which u_m was measured in Philadelphia, Pennsylvania, and $F(x)$ is a function dependent on u_m/u_t . The details of this model can be found in USEPA guidance (1996a, 1996b), and are not repeated here. The default parameter values recommended in the USEPA guidance (1996a, 1996b) are used with site-specific wind speed in calculating $J_{10,w}$. The calculation of $J_{10,w}$ is shown in Attachment 2, Table 2.

The C/Q term is estimated using the empirical correlation in USEPA’s *Supplemental Soil Screening Guidance* (2002), using the correlation coefficients for Philadelphia, Pennsylvania, and assuming a source area of 70.6 acres. This source area size is a conservative estimate using the largest area evaluated currently being characterized by PESRM. The calculation of C/Q is shown in Attachment 2, Table 4.

Unit Cancer Risk, Unit Noncancer HQ, and RBSL for Inhalation Route

For the inhalation route, the inhalation cancer unit risk and noncancer unit HQ are calculated using the chemical concentration in air (C_{air}), as follows:

$$Unit\ Risk_{inh} = C_{air} \cdot URF \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

$$Unit\ HQ_{inh} = \frac{C_{air}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

The resulting RBSLs for the inhalation route were calculated as follows:

$$Cancer\ RBSL_{inh} = \frac{C_{unit} \cdot TCRL}{UnitRisk_{inh}}$$

$$Noncancer\ RBSL_{inh} = \frac{C_{unit} \cdot THQ}{UnitHQ_{inh}}$$

The RBSLs for each route (i) were conservatively combined to give cancer and noncancer-based RBSLs that are based upon the combined receptor-specific exposure:

$$RBSL = \left(\sum_i RBSL_i^{-1} \right)^{-1}$$

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the inhalation route are presented in Attachment 2. The exposure factors used for routine workers are presented in Attachment 1, Table 3. The RBSLs for routine worker exposure to soil are provided in Attachment 1, Table 4.

2.1.2 Vapor Intrusion

RBSLs for routine worker exposure to COPC in soil via vapor intrusion were estimated from unit risks and unit HQs in accordance with the general methodology described in Section 2.1.1.

Modeling Vapor Intrusion from Soil

For the indoor air exposure pathway, the unit cancer risk and unit noncancer HQ are calculated as follows:

$$Unit\ Risk = C_{building} \cdot URF \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

$$Unit\ HQ = \frac{C_{building}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

where $C_{building}$ is the concentration in indoor air. For assessing routine worker exposures, chronic $RfCs$ are used. The indoor air concentration is estimated using the modeling approach and input parameter values discussed below.

The indoor air concentrations are estimated using the following relationships described by Johnson and Ettinger (1991):

$$C_{building} = \alpha \cdot C_{source}$$

where α is an attenuation coefficient and C_{source} is the source vapor concentration that is given by the following equation:

$$C_{source} = C_{soil} \left(\frac{K_d}{H} + \frac{\theta_w}{\rho_b H} + \frac{\theta_a}{\rho_b} \right)^{-1}$$

The attenuation coefficient, assuming that chemicals are present in the soil at constant concentrations, is given by the following equation:

$$\alpha = \frac{\left[\frac{D_T^{eff} A_B}{Q_{building} L_T} \right] \exp\left(\frac{Q_{soil} L_{crack}}{D^{crack} A_{crack}} \right)}{\exp\left(\frac{Q_{soil} L_{crack}}{D^{crack} A_{crack}} \right) + \left[\frac{D_T^{eff} A_B}{Q_{building} L_T} \right] + \left[\frac{D_T^{eff} A_B}{Q_{soil} L_T} \right] \left[\exp\left(\frac{Q_{soil} L_{crack}}{D^{crack} A_{crack}} \right) - 1 \right]}$$

Derivation of this equation and definition of the equation parameters can be found in Johnson and Ettinger's 1991 journal article and therefore are not repeated here.

The effective diffusion coefficient term D_T^{eff} in the equation for the attenuation coefficient α is calculated using a soil-water profile that is estimated using a soil type of sand, which is a conservative assumption for the range of soil types found at the Facility. The soil-water profile in the vadose zone is estimated using the van Genuchten soil-water retention equation with default water retention parameters appropriate for sand (USEPA 2004a). It is conservatively assumed that the building cracks are filled with sand. These parameters and the resulting soil-water profile in the vadose zone are shown in Attachment 2 of this appendix.

The remaining parameters in the equation for the attenuation coefficient α , which relate to building characteristics, are conservatively based on the default values for a slab-on-grade nonresidential building with an air exchange rate (ER) of 0.60 per hour as recommended by PADEP (2021). The values used in the calculations are shown in Attachment 2 of this appendix and their bases are discussed in PADEP (2021) and USEPA (2004a) guidance.

Indoor air concentrations from the soil vapor intrusion are calculated with a mass balance check. The mass balance check ensures that the assumed mass of a chemical infiltrating into the building over the assumed exposure period does not exceed an upper-bound estimate of the chemical's mass in the vadose zone underlying the building. The upper-bound estimate of the constituent's mass in the vadose zone is conservatively estimated using the highest concentration of the constituent from any depth at each area and assuming this concentration represents the soil concentration from slab to the water table. The attenuation coefficient α_{ML} used in the mass balance check is given by the following equation:

$$\alpha_{ML} = \left(\frac{\rho_b K_d}{H} + \frac{\theta_w}{H} + \theta_a \right) \cdot \left(\frac{L_B \cdot W_B \cdot \Delta H}{Q_{building} \cdot ED} \right)$$

where L_B is the length of the building, W_B is the width of the building, ΔH is the contaminant thickness (conservatively assumed to be the distance between groundwater and a building foundation (L_{T-gw})), and $Q_{building}$ is the air flow rate through the building. The depth to groundwater is conservatively assumed to be 19 ft bgs⁵. All parameters are shown in Attachment 2 of this appendix.

$Q_{building}$ is a function of the size of the building (or unit) and the amount of air exchanges that occur as a result of operating the air handling and ventilation system. It can be calculated as follows (USEPA 2004a, 2017b):

$$Q_{building} = L_B \cdot W_B \cdot H_B \cdot ER$$

where H_B is the occupied height of the building and ER is the air exchange rate.

⁵ Depth to groundwater varies across the Facility. 19 ft bgs is the average depth to groundwater in Tanks Groups 02, 03, 04, and 05. The average depth to groundwater in Tank Group 01 is 10 ft bgs. The average depth to groundwater in Tank Groups 06, 07, and 08 is 3 ft bgs. Using a depth to groundwater of 19 ft bgs results in the most conservative RBSLs for this exposure route in comparison to using groundwater depths observed at other areas of the Facility.

For $Q_{building}$, the length (10 m), width (10 m), and height (2.44 m) of the generic nonresidential building were assumed, consistent with PADEP's recommended default assumptions for generic slab-on-grade nonresidential buildings (PADEP 2021). A conservative estimate of ER (i.e., 0.60/hr) was assumed based upon PADEP's (2021) recommended default for a generic nonresidential building.

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the inhalation route are presented in Attachment 2 of this appendix. The RBSLs for routine worker exposure to soil are provided in Attachment 1, Table 4.

2.2 Construction Workers

RBSLs for construction worker exposure to COPC in soil via incidental ingestion, dermal contact, and inhalation of particulates and vapors were estimated from unit risks and unit HQs in a manner analogous to the calculation described in Section 2.1.1 for routine workers. The only differences are the use of exposure factors for construction workers and that airborne dust concentrations are estimated as discussed below.

During construction activities the PM_{10} level is set at 50 micrograms per cubic meter, which is the former annual average National Ambient Air Quality Standard for PM_{10} since construction workers are assumed to be performing excavations for a work year. It is conservatively assumed that the PM_{10} concentration would be at this limit every day for the entire period of construction worker exposure.

The unit risk, unit HQ, and resulting RBSL calculations for each COPC are presented in Attachment 3. The exposure factors used for construction workers are presented in Attachment 1, Table 3. The RBSLs for construction worker exposure to soil are provided in Attachment 1, Table 4.

2.3 Soil Migration-to-Groundwater

RBSLs developed to conservatively evaluate the potential for COPC in soil to leach to groundwater at concentrations that may pose an unacceptable risk to human health or the environment are calculated using the methodologies described in the *Soil Screening Guidance: User's Guide* (USEPA 1996a).

RBSLs were calculated using both an "equilibrium partitioning" (also called soil/water partitioning [USEPA 1996a]) and a "leach test" methodology, as described below. For each COPC, the soil screening level corresponding to the more realistic of the two calculation methods is used as a soil migration-to-groundwater screening level. For COPC that are relatively immobile in the subsurface (e.g., semivolatile organic compounds), the equilibrium partitioning method provides a more realistic, yet conservative, soil leachate concentration because it assumes that the chemical concentration in soil remains constant over time (since the chemical is immobile, its concentration in soil does not significantly decrease over time). For chemicals that are relatively mobile (e.g., volatile organic compounds), the leach test method provides a more realistic, yet conservative, soil leachate concentration because it accounts for a finite amount of chemical mass in the soil. These two approaches of estimating soil leachate concentrations are conservative since they ignore attenuation of the chemical concentration in the vadose zone and dilution at the water table.

Equilibrium Partitioning

The soil/water partition equation, which assumes an infinite source of the chemical, can be used to estimate concentrations of chemicals in soil leachate for a given soil concentration.

$$C_{soil} = C_{pw} \left(K_d + \frac{\theta_w + \theta_a H}{\rho_b} \right)$$

In this relationship, C_{soil} is the soil concentration (mg/kg), C_{pw} is the soil leachate concentration (milligrams per liter [mg/L]), K_d is the chemical specific soil-water partition coefficient (liter per kilogram), θ_w is the water-filled soil porosity (unitless), θ_a is the air-filled soil porosity (unitless), H is the chemical-specific Henry's Law constant (unitless), and ρ_b is the dry soil bulk density (kilogram per liter [kg/L]). For organic chemicals, K_d is equal to the product of the chemical-specific soil organic carbon/water partition coefficient, K_{oc} (liter per kg), and the fraction organic carbon in soil, f_{oc} (unitless). For this analysis, the soil properties are based upon sand, the most conservative soil type identified at the Site. Specifically, θ_w is assumed to be 0.05 (liters per liter), θ_a is assumed to be 0.32 (liters per liter), and ρ_b is assumed to be 1.66 kg/L (USEPA 2004a).⁶ The f_{oc} is assumed to be 0.005 (grams per gram) (USEPA 1996a). The chemical-specific K_d , and K_{oc} , and H (and their sources) used are presented in Attachment 4.

Leach Test Method

USEPA's leach test method (SW-846, Method 1312)⁷ can be simulated by assuming a hypothetical worst-case leach test outcome in which the entire mass of the chemical in soil is extracted into the leaching fluid. With this assumption, the concentration of the COPC in soil can be divided by 20 (which is the ratio of the mass of leaching fluid to the mass of soil in the leaching test protocol) to estimate its leachate concentration as follows:

$$C_{soil} = C_{pw} \times \frac{mr_{fluid:solid}}{\rho_{fluid}}$$

In the relationship above, C_{soil} is the soil concentration (mg/kg), C_{pw} is the soil leachate concentration (mg/L), $mr_{fluid:solid}$ (kilogram per kilogram) is the mass ratio of the extraction fluid to soil used in the leach test (i.e., 20 kg fluid per 1 kg soil), and ρ_{fluid} (kg/L) is the density of the extraction fluid (assumed to be 1 kg/L).

Dilution Attenuation Factor and Calculation of Soil Migration to Groundwater Screening Levels

As soil leachate moves through soil and groundwater, chemical concentrations are attenuated. The reduction in concentrations can be expressed by a dilution attenuation factor (DAF) defined as a ratio of soil leachate concentration to receptor point concentration (USEPA 1996a).

⁶ Water-filled and air-filled porosity were estimated using the soil properties for sand (USEPA 2004) and the van Genuchten equation (van Genuchten 1980), assuming a depth to groundwater of 19 ft.

⁷ Method 1312: Synthetic Precipitation Leaching Procedure, <https://www.epa.gov/sites/production/files/2015-12/documents/1312.pdf>.

Rather than independently model leachate migration to calculate a site-specific *DAF*, a generic *DAF* of 20 was conservatively used in the development of the RBSLs. This default *DAF* is recommended by USEPA (1996a) for contaminated soil sources up to 0.5 acres.

To calculate soil migration to groundwater screening levels, the equations presented above can be further refined as follows:

$$C_{soil-SPLP} = C_{pw} \times \frac{m_{fluid:solid}}{\rho_{fluid}} \times DAF$$

$$C_{soil-Kd} = C_{pw} \left(K_d + \frac{\theta_w + \theta_a H}{\rho_b} \right) \times DAF$$

By substituting target groundwater concentrations for C_{pw} in the leach test method and equilibrium-partitioning method equations, and assuming a *DAF*, two possible soil screening levels are calculated. The higher of the two estimated values was used as the RBSL as the higher represents the more realistic, yet conservative, soil screening level for this pathway.

The target groundwater concentration for these screening levels is based on the minimum of the following groundwater RBSLs:

- Routine worker exposure to COPC in groundwater via volatilization to outdoor air and vapor intrusion
- Construction worker exposure to COPC in groundwater via direct contact
- Off-site resident exposure to COPC in groundwater via vapor intrusion
- Receptor exposure to COPC in groundwater via nonpotable groundwater use
- Migration of COPC in groundwater to surface water

The acceptable groundwater concentrations are presented in Attachment 4. The soil migration-to-groundwater screening levels are presented in Attachment 1, Table 4.

2.4 Lead

Exposure of routine workers to lead in soil during outdoor activities is evaluated using a screening level of 2,520 mg/kg. This screening level is calculated following USEPA guidance (USEPA 2003), including updates (USEPA 2009, 2017a). The screening level is intended to protect female workers of child-bearing age who contact soil.

The derivation of the industrial soil screening level is presented in Attachment 2, Table 12.

3 Risk-Based Screening Levels for Groundwater

This section details how RBSLs for groundwater are calculated for the routine worker (Section 3.1), construction worker (Section 3.2), and off-facility residential (Section 3.3) exposure scenarios. RBSLs which consider potential off-facility nonpotable groundwater use and surface water exposure are detailed in Sections 3.4 and 3.5, respectively.

The resulting RBSLs are presented in Attachment 1, Table 4.

3.1 Routine Workers

The RBSLs are calculated to evaluate commercial/industrial worker exposures to COPC via: (1) volatilization to outdoor air from groundwater and (2) vapor intrusion from groundwater.

3.1.1 Exposure to Groundwater Via Volatilization to Outdoor Air

RBSLs for routine worker exposure to COPC in groundwater via volatilization to outdoor air were estimated from unit risks and unit HQs in accordance with the general methodology discussed in Section 2.1.1, except for the calculation of the vapor flux J .

Vapor emissions from groundwater (not exposed) are calculated using the steady-state diffusion equation in one-dimension assuming a constant source concentration and a maximum concentration gradient, as follows:

$$J = D_e \cdot \frac{C_v}{L}$$

where D_e is the effective diffusion coefficient of the chemical in the vapor phase, C_v is the vapor concentration in equilibrium with the groundwater concentration, and L is the distance from the water table to the ground surface. The equilibrium “source” vapor concentration in the above equations is related to the chemicals’ groundwater concentration (C_{gw}) using Henry’s law (H):

$$C_{source} = C_{gw} \cdot H$$

D_e for the vapor phase is calculated using a soil-water profile that is estimated using a soil type of sand, the most conservative soil type identified at the Facility. The soil-water profile in the vadose zone, shown in Attachment 2, is estimated using the van Genuchten soil-water retention equation with default water retention parameters appropriate for sand (USEPA 2004a). The depth to groundwater is assumed to be 3 ft bgs⁸.

⁸ Depth to groundwater varies across the Facility. 19 ft bgs is the average depth to groundwater in Tanks Groups 02, 03, 04, and 05. The average depth to groundwater in Tank Group 01 is 10 ft bgs. The average depth to groundwater in Tank Groups 06, 07, and 08 is 3 ft bgs. Using a depth to groundwater of 3 ft bgs results in the most conservative RBSLs for this exposure route in comparison to using groundwater depths observed at other areas of the Facility.

The calculation of D_e is shown in Attachment 2.

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the inhalation route are presented in Attachment 2. The exposure factors used for routine workers are presented in Attachment 1, Table 3. The RBSLs for routine worker exposure to groundwater are provided in Attachment 1, Table 4.

3.1.2 Vapor Intrusion

RBSLs for routine worker exposure to COPC via vapor intrusion from groundwater are estimated from unit risks and unit HQs in accordance with the general methodology described in Section 2.1.2, except for the calculation of source vapor concentration.

The source vapor concentration for a chemical in groundwater is calculated from the chemical's concentration in groundwater C_{gw} using Henry's law as follows:

$$C_{source} = C_{gw} \cdot H$$

In calculating the attenuation coefficient α , the depth to groundwater was conservatively assumed to be 3 ft bgs below the basement slab. The calculation of α is shown in Attachment 2 of this appendix.

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the inhalation route are presented in Attachment 2. The exposure factors used for routine workers are presented in Attachment 1, Table 3. The RBSLs for routine worker exposure to groundwater are provided in Attachment 1, Table 4.

3.2 Construction Workers

RBSLs for construction worker exposure to COPC in groundwater via incidental ingestion, dermal contact, and inhalation of vapors during excavations that extend into the water table are estimated from unit risks and unit HQs in accordance with the general methodology described in Section 2.1.1.

Lifetime Average Daily Dose

The LADD for groundwater ingestion ($LADD_{ing}$) and groundwater dermal contact ($LADD_{derm}$) were calculated as follows:

$$LADD_{ing} = C_{gw} \frac{IR \cdot EF \cdot ED}{BW \cdot AT_c}$$

$$LADD_{derm} = C_{gw} \frac{DA_{event} \cdot SA \cdot EV \cdot EF \cdot ED}{BW \cdot AT_c}$$

where C_{gw} is the chemical concentration in groundwater (assumed to be a unit concentration of 1 mg/L), IR is the groundwater ingestion rate, DA_{event} is the absorbed dose per event, SA is the exposed skin surface area, and EV is the event frequency.

The DA_{event} for organic chemicals is estimated using an unsteady-state approach (USEPA 2004b, Equations 3.2 and 3.3), which is more conservative than the steady-state approach (USEPA 1989), particularly for hydrophobic chemicals. The DA_{event} for inorganic chemicals is estimated using a steady-state approach (USEPA 2004b, Equation 3.4). The details of the calculation of DA_{event} for organic and inorganic chemicals are provided by USEPA (2004b) and not repeated here.

Average Daily Dose

Average daily dose (ADD) for groundwater ingestion (ADD_{ing}) and groundwater dermal contact (ADD_{derm}) were calculated as follows:

$$ADD_{ing} = C_{gw} \frac{IR \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

$$ADD_{derm} = C_{gw} \frac{DA_{event} \cdot SA \cdot EV \cdot EF \cdot ED}{BW \cdot AT_{nc}}$$

Unit Cancer Risk, Unit Noncancer HQ, and RBSL for Groundwater Ingestion and Dermal Exposure Routes

For the groundwater ingestion and dermal exposure routes, the unit cancer risk and unit noncancer HQ were calculated as follows:

$$Unit\ Risk = LADD \cdot SF$$

$$Unit\ HQ = \frac{ADD}{RfD}$$

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the groundwater ingestion and dermal exposure routes are presented in Attachment 3. The exposure factors used for construction workers are presented in Attachment 1, Table 3. The RBSLs for construction worker exposure to groundwater are provided in Attachment 1, Table 4.

Estimating Air Concentrations

For the inhalation route, the air concentrations (C_{air}) resulting from the volatilization of COCs from groundwater in an excavation were calculated as follows:

$$C_{air} = J \cdot C/Q$$

Where $J \cdot C/Q$ is an air concentration that is normalized to unit concentration (i.e., 1 mg/L) in groundwater. The J term is the normalized average vapor and the C/Q term is the air concentration normalized to a unit flux (i.e., C/Q is an air dispersion factor).

The normalized vapor flux J of a chemical from groundwater was estimated using an overall mass transfer coefficient that is recommended by USEPA (1995b):

$$J = \left(\frac{1}{k_l} + \frac{1}{Hk_g} \right)^{-1} \left(\frac{m}{10^2 cm} \right) \left(\frac{10^3 L}{m^3} \right)$$

Where k_l and k_g are the liquid-phase and gas-phase mass transfer coefficients given by the following:

$$k_l = \left(\frac{MW_o}{MW}\right)^{0.5} \left(\frac{T}{298K}\right) k_{l,o}$$

$$k_g = \left(\frac{MW_w}{MW}\right)^{0.335} \left(\frac{T}{298K}\right)^{1.005} k_{g,w}$$

Where MW , MW_o , and MW_w are the molecular weights of the chemical, oxygen, and water, respectively, T is the absolute temperature of the groundwater, $k_{l,o}$ is the liquid-phase mass transfer coefficient for oxygen (0.002 centimeters per second), and $k_{g,w}$ is the gas-phase mass transfer coefficient for water vapor (0.833 centimeters per second).

For groundwater exposures during excavations to the water table, C/Q is based on a source area of a 15- by 15-foot excavation area, and an averaging period of 24 hours. The maximum 24-hour average air concentration is estimated from the annual average air concentration by using a conservative factor of 0.4/0.19 or 2.1 (USEPA 2002).

Unit Cancer Risk, Unit Noncancer HQ, and RBSL for Inhalation Route

For the inhalation route, the inhalation cancer unit risk and noncancer unit HQ are calculated using the chemical concentration in air (C_{air}), as follows:

$$Unit\ Risk_{inh} = C_{air} \cdot URF \cdot \frac{ET \cdot EF \cdot ED}{AT_c}$$

$$Unit\ HQ_{inh} = \frac{C_{air}}{RfC} \cdot \frac{ET \cdot EF \cdot ED}{AT_{nc}}$$

The unit risk, unit HQ, and resulting RBSLs calculations for each COPC for the inhalation route are presented in Attachment 3. The exposure factors used for construction workers are presented in Attachment 1, Table 3. The RBSLs for construction worker exposure to groundwater are provided in Attachment 1, Table 4.

3.3 Off-Facility Resident

RBSLs for off-facility resident exposure to COPC via vapor intrusion from groundwater were estimated from unit risks and unit HQs in accordance with the general methodology described in Section 2.1.2 for routine workers. The only differences are the use of exposure factors for off-facility residents and that a depth to groundwater of 19 ft bgs was used, consistent with the average depth to groundwater identified in areas currently being investigated by PESRM that are in closest proximity to off-facility residential areas.⁹

⁹ Tank Groups 02, 03, 04, and 05

The unit risk, unit HQ, and resulting RBSL calculations for each COPC are presented in Attachment 5. The exposure factors used for routine workers are presented in Attachment 1, Table 3. The RBSLs for off-facility resident exposure to groundwater are provided in Attachment 1, Table 4.

3.4 Nonpotable Groundwater Use

Potential exposures to COPC in groundwater via nonpotable groundwater use are evaluated using a hypothetical scenario where groundwater is used to fill a backyard wading pool (“kiddie” pool). This scenario represents a reasonable worst case exposure scenario in which the estimated exposure is expected to be higher than those associated with other nonpotable uses (e.g., watering lawns, washing cars). Potential routes of exposure in this scenario include incidental ingestion, dermal contact, and inhalation of vapors. RBSLs were estimated from unit risks and unit HQs in accordance with the general methodology described in Section 2.1.1 and the following exposure factors:

Exposure Factors

For this evaluation, standard default exposure factors recommended by PADEP and USEPA for estimating RME are used where available and appropriate. Where standard default exposure factors are not available or appropriate for an exposure scenario, the evaluation is conducted using similarly conservative exposure factors that are based on site-specific considerations and professional judgment.

Exposure Frequency and Duration

The exposure frequency for the kiddie pool scenario is 96 days/year, which is based on 4 days per week for the number of months, 6 months, when the average daily temperature is above 65 degrees Fahrenheit in Philadelphia, Pennsylvania (NOAA 2018). Residents are assumed to be exposed to groundwater for 26 years (6 years as children and 20 years as adults; USEPA 2014). This combination of exposure frequency and exposure duration is expected to be conservative for the amount of time that residents would actually spend using groundwater off-facility.

Incidental Water Ingestion

The rate of 0.05 L/hour is the USEPA-recommended value for ingestion of water while swimming (USEPA 1989).

Dermal Contact Rate

The exposed skin surface areas of 6,365 cm² and 19,652 cm² are USEPA’s recommended values for evaluating RME with groundwater by children and adults, respectively (USEPA 2014). Child and adult residents are assumed to wade in the pool for 2 hours per event, and one event per day, based on professional judgment. The absorbed dose for organic chemicals is estimated using the nonsteady-state approach (USEPA 2004b), which is more conservative than the steady-state approach (USEPA 1989), particularly for hydrophobic chemicals. The permeability coefficient (K_p) for dermal absorption of organic chemicals from groundwater is estimated following USEPA guidance (USEPA 2004b).

Water Concentration in Kiddie Pool

The model for estimating vapor emission from a residential kiddie pool is based on models for estimating vapor emissions from open-top batch tanks (USEPA 1995a, 1995b). The residential kiddie pool is modeled as a 6-ft diameter tank that is 9 inches deep and is assumed to be filled with groundwater once per day. The concentration of volatile organic chemicals in the kiddie pool water decreases over time as the chemicals volatilize into the air. The average concentration over a period t is given by:

$$\bar{C}_w = C_{w,o} \frac{d}{K \cdot t} (1 - e^{-Kt/d})$$

where $C_{w,o}$ is the initial concentration, d is the depth of water in the pool and K is the chemical's overall mass transfer coefficient (USEPA 1995b). K is calculated as follows:

$$K = \frac{k_l \cdot H k_g}{k_l + H k_g}$$

where H is the Henry's law constant, and k_l and k_g are the liquid-phase and gas-phase mass transfer coefficients given by the following equations (USEPA 1995a):

$$k_l = 10^{-6} + 144 \cdot 10^{-4} (0.01 u_{10} \sqrt{6.1 + 0.63 u_{10}})^{2.2} S_{c_l}^{-0.5}$$

$$k_g = 4.82 \cdot 10^{-3} u_{10}^{0.78} S_{c_g}^{-0.67} d_e^{-0.11}$$

where S_{c_l} and S_{c_g} are liquid-phase and gas-phase Schmidt numbers, d_e is the effective diameter of the water surface (m), and u_{10} is wind speed at 10 m above the water surface, which is 4.2 m/s based on the annual average wind speed in Philadelphia, Pennsylvania (NOAA 2018).

Air Concentration from Kiddie Pool

The concentration of the chemical in air at the water surface is given by the following:

$$C_{air} = \bar{C}_w \cdot K \cdot (C/Q)$$

The C/Q term is estimated using the empirical correlation in USEPA's *Supplemental Soil Screening Guidance* (2002), using the correlation coefficients for Philadelphia, Pennsylvania, and assuming a source area of a 6 by 6 foot kiddie pool. This air concentration is expected to be higher than actual air concentrations to which individuals would be exposed while in the kiddie pool.

Unit Cancer Risk, Unit Noncancer HQ, and RBSL

The unit risk, unit HQ, and resulting RBSL calculations for each COPC for the groundwater ingestion, dermal, and inhalation of vapor exposure routes are presented in Attachment 6. The RBSLs for off-facility nonpotable groundwater use are provided in Attachment 1, Table 4.

3.5 Groundwater Migration-to-Surface Water

This section explains how groundwater screening levels are derived to support the evaluation of groundwater-to-surface water exposure scenarios.

The groundwater (MtsW) screening levels are based upon specific water quality criteria consistent with the designated water use of the Schuylkill River¹⁰ and the National Recommended Water Quality Criteria for human health consumption of organisms only¹¹. The minimum of these criteria was conservatively selected. Where criteria were not available for a specific chemical, the criteria were selected from the USEPA Region 3 Biological Technical Assistance Group Freshwater Screening Benchmarks¹² or the USEPA Region 4 Ecological Screening Values¹³.

Per the analysis conducted by Baird (2002), a conservative estimate of the groundwater-surface water mixing ratio of 0.0013 (or a dilution factor ~ 1000) was used to conservatively derive groundwater concentrations that would be protective of surface water exposures in the Schuylkill River.

Parameter	Value	Units	Basis
Exposure Factors	Various	-	High-end exposure factors compiled for each receptor/exposure scenario. Based upon standard default exposure factors used by PADEP [25 Pa Code 250.602(c)(2)] and USEPA (1991, 2011, 2014) for estimating reasonable maximum exposures.
Toxicity Values	Various	-	Compiled in accordance with USEPA (2003)
Target Cancer Risk Level	1x10 ⁻⁵	-	Project-Specific
Target Noncancer Hazard Quotient	0.1	-	Project-Specific
Dispersion Model Correlation Area	Philadelphia	-	Per USEPA (2002)
Emission Area for Soil and Noncontact GW Exposures	70.6	acres	Total area of the largest Tank Group (i.e., Tank Group 04)
Mean Annual Wind Speed	9.3	mph	NOAA (2018), For Philadelphia
Depth to Groundwater			
Tank Group 01	10	ft bgs	Temporal and spatial average depth to groundwater
Tank Group 02, 03, 04, and 05	19	ft bgs	
Tank Group 06, 07, 08	3	ft bgs	
Soil Type	Sand	-	Based upon the extensive presence of fill material across the Site
Fraction Organic Carbon	0.005	unitless	Per PADEP (2021)
Building Parameter Assumptions			
Commercial/Industrial			PADEP (2021) Default
Bldg foundation thickness	0.1	m	
Bldg foundation length	10	m	
Bldg foundation width	10	m	
Bldg occupied height	2.44	m	
Occupied depth below ground	0.15	m	
Air exchange rate	0.6	hr ⁻¹	
Crack radius	1E-03	m	
Distance from contaminated soil to foundation	0.001	m	
Soil gas entry flow rate (Q _{soil})	5	L/min	
Off-Site Residential			
Bldg foundation thickness	0.1	m	
Bldg foundation length	10	m	
Bldg foundation width	10	m	
Bldg occupied height	3.66	m	
Occupied depth below ground	2	m	
Air exchange rate	0.18	hr ⁻¹	
Crack radius	1E-03	m	
Distance from contaminated soil to foundation	0.001	m	
Soil gas entry flow rate (Q _{soil})	5	L/min

Abbreviations:

Chem Group - chemical group

INORG - metals

SVOC - semi-volatile organic compounds

VOC - volatile organic compounds

MtGW - migration to groundwater

MTSW - migration to surface water

NV - not volatile

WIT - without inhalation toxicity data

NA - not applicable: target groundwater concentration times DAF is greater than constituent's solubility.

IE - inadequate exposure

NSW - no surface water quality criteria available

Table 1:

Normalized Average Vapor Flux from Soil to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Soil bulk density	kg/L	ρ_b	1.66
Soil porosity	L/L-soil	θ	0.38
Soil water content	L/L-soil	θ_w	0.05
Soil air-filled porosity	L/L-soil	θ_a	0.32
Soil organic carbon fraction	unitless	f_{oc}	0.005
Averaging period (Exposure Duration)	years	T	25
	days	T	9125
Temperature	$^{\circ}\text{C}$	Temp	18
Clean soil above source	m	Z_1	
Bottom of source depth	m	Z_2	5.79

Based on the volatilization model developed by Jury et. al. (1983) for finite sources as described in USEPA's (1996) Soil Screening Guidance: Technical Background Document. The K_d for organic compounds is the K_{oc} times the f_{oc} .

Attachment 2

Table 2:

Soil PM₁₀ Emission from Wind Erosion

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Unlimited Reservoir Model

Parameter	Units	Variable	Value
Aerodynamic particle size multiplier			0.036
Ground cover fraction		G	0.5
Mode of aggregate size distribution	mm		0.50
Threshold friction velocity	m/s	u'_t	0.50
Correction factor			1.25
Corrected friction velocity	m/s	u*_t	0.6252
Roughness height	m	z₀	0.005
Anemometer height	m		8.0
Friction velocity at anemometer height	m/s	u_t	11.53
Mean annual wind speed	mph	u_m	9.3
Mean annual wind speed	m/s	u_m	4.16
u_m/u_t			0.361
$x = 0.886 u_t/u_m$			2.46
F(x)			0.064
Annual average PM₁₀ flux	kg-soil/m²-s	J_{10,w}	1.5E-11

Model described in more detail in USEPA's (1996) *Soil Screening Guidance: Technical Background Document* .

Attachment 2

Table 3:

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Soil source area	acres	70.6
		Annual
Soil C/Q averaging time		Max
Conversion factor from 1-Hr Max for soil		0.19
C/Q for soil	(kg/m³)/(kg/m²-s)	25.06

Groundwater source area	acres	70.6000
		Annual
Groundwater averaging time for C/Q		Max
Conversion factor from 1-Hr Max for groundwater		0.19
C/Q for Groundwater	(L/m³)/(L/m²-s)	25.06

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Attachment 2

Table 4:

Concentrations in Outdoor Air from Soil

Table 6:

Normalized Indoor Air Concentration in a Default PADEP Nonresidential Building (Slab-On-Grade) Due to Vapor Intrusion from Soil

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes: Subsurface and Building Characteristics			Crack Soil
SCS Soil texture class			Sand
Bulk density	kg/L	ρ_b	1.66
Total porosity	L/L-soil	θ_T	0.375
Water-filled porosity	L/L-soil	θ_w	0.053
Air-filled porosity	L/L-soil	θ_a	0.322
Organic carbon fraction	unitless	f_{OC}	NA
Residual saturation	L/L-soil	θ_r	0.053
Hydraulic conductivity	cm/s	K	7.4E-03
Dynamic viscosity of water	g/cm-s	μ_w	0.01307
Density of water	g/cm ³	ρ_w	1.0
Gravitational acceleration	cm/s ²	g	980.7
Intrinsic permeability	cm ²	k	9.9E-08
Relative saturation	unitless	S_e	0.001
van Genuchten N	unitless	N	3.18
van Genuchten M	unitless	M	0.685
Relative air permeability	unitless	k_{rg}	0.999
Permeability to vapor	cm ²	k_v	9.9E-08
Distance from building foundation to source	m	L_{T-soil}	0.001
Bldg foundation thickness	m	L_{crack}	0.1
Bldg foundation length	m		10.00
Bldg foundation width	m		10.00
Bldg occupied height	m		2.44
Bldg occupied volume	m ³		244.00
Occupied depth below ground	m		0.2
Bldg area for vapor intrusion	m ²	A_B	106.0
Ratio of A_{crack} to A_B		η	4E-04
Area of cracks	m ²	A_{crack}	4.00E-02
Air exchange rate	hour ⁻¹	ach	0.6
Building ventilation rate	m ³ /day	Q_{bldg}	3.51E+03
Pressure difference between outdoors-indoors	kg/m-s ²	ΔP	1.0
Viscosity of air	kg/m-s	μ_a	1.8E-05
Crack length (bldg perimeter)	m	X_{crack}	40
Crack depth below ground	m	Z_{crack}	0.25
Crack radius	m	r_{crack}	1E-03
Soil gas flow rate into bldg	m ³ /day	Q_{soil}	7.20E+00
Averaging period	d	ED	9.13E+03
Contaminant thickness	m	ΔH	5.5

Normalized Indoor Air Concentration in a Default PADEP Nonresidential Building (Slab-On-Grade) Due to Vapor Intrusion from Groundwater

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Subsurface and Building Characteristics			Crack Soil
SCS Soil texture class			Sand
Bulk density	kg/L	ρ_b	1.66
Total porosity	L/L-soil	θ_T	0.375
Water-filled porosity	L/L-soil	θ_w	0.090
Air-filled porosity	L/L-soil	θ_a	0.285
Residual saturation	L/L-soil	θ_r	0.053
Hydraulic conductivity	cm/s	K	7.4E-03
Dynamic viscosity of water	g/cm-s	μ_w	0.01307
Density of water	g/cm ³	ρ_w	1.0
Gravitational acceleration	cm/s ²	g	980.7
Intrinsic permeability	cm ²	k	9.9E-08
Relative saturation	unitless	S_e	0.115
van Genuchten N	unitless	N	3.177
van Genuchten M	unitless	M	0.685
Relative air permeability	unitless	k_{rg}	0.887
Permeability to vapor	cm ²	k_v	8.79E-08
Distance from foundation to source	m	L_{T-gw}	0.66
Bldg foundation thickness	m	L_{crack}	0.1
Bldg foundation length	m		10.00
Bldg foundation width	m		10.00
Bldg occupied height	m		2.44
Bldg occupied volume	m ³		244.00
Occupied depth below ground	m		0.2
Bldg area for vapor intrusion	m ²	A_B	106.0
Ratio of A_{crack} to A_B		η	4E-04
Area of cracks	m ²	A_{crack}	4E-02
Air exchange rate	hour ⁻¹	ach	0.60
Building ventilation rate	m ³ /day	Q_{bldg}	3.5E+03
Pressure diff. outdoors-indoors	kg/m-s ²	ΔP	1.0
Viscosity of air	kg/m-s	μ_a	1.8E-05
Crack length (bldg perimeter)	m	X_{crack}	40
Crack depth below ground	m	Z_{crack}	0.25
Crack radius	m	r_{crack}	1E-03
Soil gas flow rate into bldg	m ³ /day	Q_{soil}	7.20

INORG	Vanadium	7440-62-2	ID	1.00E+00					1.0E-04		

Notes:

Cancer RBSLs are calculated at a target cancer risk of 1E-05.

Noncancer RBSLs are calculated at a target HQ of 0.1.

Attachment 2

Table 12:

Blood Lead Model for Adult Exposure to Lead in Soil

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Soil Ingestion

Soil Pb concentration		mg-Pb/kg-soil	2,518
Gastrointestinal absorption	AF	unitless	0.12
Ingestion rate	IR	mg-soil/day	50
Conversion factor		kg/mg	1E-06
Exposure frequency	EF	days/year	219
Averaging time	AT	days	365

Baseline blood lead	PbB_{baseline}	ug-Pb/dL	0.6
Biokinetic slope factor	BSF	ug-Pb/dL per ug-Pb/day	0.4
Geometric std deviation	GSD		1.8

Blood lead goal	PbB_{goal}	ug-Pb/dL	10
-----------------	---------------------------	----------	----

Soil Pb to meet PbB_{goal} at specific percentiles	z	Percentile	Soil Pb (mg/kg)
	0.000	50	7,299
	0.674	75	4,774
	1.036	85	3,779
	1.282	90	3,216
	1.645	95	2,518
	2.054	98	1,891
	2.326	99	1,549

Notes:

The model is adapted from the methodology provided in *Recommendations of the Technical Review Workgroup for Lead for an Approach to Assessing Risks associated with Adult Exposure to Lead in Soil* (USEPA 2003), including *Update of the Adult Lead Methodology's Default Baseline Blood Lead Concentration and Geometric Standard Deviation Parameters* (USEPA 2017).

The shaded value represents the screening level.

Table 1:

Normalized Average Vapor Flux from Soil to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Soil bulk density	kg/L	ρ_b	1.66
Soil porosity	L/L-soil	θ	0.38
Soil water content	L/L-soil	θ_w	0.05
Soil air-filled porosity	L/L-soil	θ_a	0.32
Soil organic carbon fraction	unitless	f_{oc}	0.005
Averaging period (Exposure Duration)	years	T	1
	days	T	365
Temperature	$^{\circ}\text{C}$	Temp	18
Clean soil above source	m	Z_1	
Bottom of source depth	m	Z_2	5.79

Based on the volatilization model developed by Jury et. al. (1983) for finite sources as described in USEPA's (1996) Soil Screening Guidance: Technical Background Document. The K_d for organic compounds is the K_{oc} times the f_{oc} .

Attachment 3

Table 2:

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Soil source area	acres	70.6
Soil C/Q averaging time		Annual Max
Conversion factor from 1-Hr Max for soil		0.19
C/Q for soil	(kg/m³)/(kg/m²-s)	25.06

Groundwater source area	acres	0.0052
Groundwater averaging time for C/Q		24-Hour Max
Conversion factor from 1-Hr Max for groundwater		0.40
C/Q for Groundwater	(L/m³)/(L/m²-s)	9.63

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Notes:

The concentration of particulates in the air is assumed to be no more than the former annual National Ambient Air Quality Standards (NAAQS) for PM₁₀ of 50 ug/m³.
 Cancer RBSLs are calculated at a target cancer risk of 1E-05.

Notes:

The concentration of particulates in the air is assumed to be no more than the former annual National Ambient Air Quality Standards (NAAQS) for PM₁₀ of 50 ug/m³. Noncancer RBSLs are calculated at a target HQ of 0.1.

Notes:
 Event Time hours t 2
 K_p capped at 1 cm/hr (USEPA 1992).
 The dermal absorbed dose for inorganic chemicals is estimated using a steady-state approach (USEPA 2004, Equation 3.4) and for organic chemicals is estimated using a nonsteady-state approach (USEPA 2004, Equations 3.2 and 3.3).

Table 2

Soil Migration to Groundwater Criteria

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

f_{oc}	Fraction organic carbon	0.005
ρ_b	Soil bulk density	1.66
n	Total porosity	0.38
θ_w	Water-filled soil porosity	0.05
θ_a	Air-filled soil porosity	0.32
DAF	Dilution attenuation factor	20

Only chemicals detected in soil are shown.

$C_{soil-MtGW-Eq}$: Soil screening level based on equilibrium partitioning (EQ)

$C_{soil-MtGW-Lt}$: Soil screening level based on simulated worst-case leach test (LT)

NA: Not applicable - target groundwater concentration times DAF is greater than constituent's solubility.

The K_d for organic compounds is the K_{oc} times the f_{oc} .

Normalized Indoor Air Concentration in a Default PADEP Residential Building (w/ Basement) Due to Vapor Intrusion from Groundwater
Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Notes:

Subsurface and Building Characteristics			Crack Soil
SCS Soil texture class			Sand
Bulk density	kg/L	ρ_b	1.66
Total porosity	L/L-soil	θ_T	0.375
Water-filled porosity	L/L-soil	θ_w	0.054
Air-filled porosity	L/L-soil	θ_a	0.321
Residual saturation	L/L-soil	θ_r	0.053
Hydraulic conductivity	cm/s	K	7.4E-03
Dynamic viscosity of water	g/cm-s	μ_w	0.01307
Density of water	g/cm ³	ρ_w	1.0
Gravitational acceleration	cm/s ²	g	980.7
Intrinsic permeability	cm ²	k	9.9E-08
Relative saturation	unitless	S_e	0.003
van Genuchten N	unitless	N	3.177
van Genuchten M	unitless	M	0.685
Relative air permeability	unitless	k_{rg}	0.998
Permeability to vapor	cm ²	k_v	9.90E-08
Distance from foundation to source	m	L_{T-gw}	3.69
Bldg foundation thickness	m	L_{crack}	0.1
Bldg foundation length	m		10.00
Bldg foundation width	m		10.00
Bldg occupied height	m		3.66
Bldg occupied volume	m ³		366.00
Occupied depth below ground	m		2.0
Bldg area for vapor intrusion	m ²	A_B	180.0
Ratio of A_{crack} to A_B		η	2E-04
Area of cracks	m ²	A_{crack}	4E-02
Air exchange rate	hour ⁻¹	ach	0.18
Building ventilation rate	m ³ /day	Q_{bldg}	1.6E+03
Pressure diff. outdoors-indoors	kg/m-s ²	ΔP	4.0
Viscosity of air	kg/m-s	μ_a	1.8E-05
Crack length (bldg perimeter)	m	X_{crack}	40
Crack depth below ground	m	Z_{crack}	2.10
Crack radius	m	r_{crack}	1E-03
Soil gas flow rate into bldg	m ³ /day	Q_{soil}	7.20

Notes:

Event Time hours t 2

K_p capped at 1 cm/hr (USEPA 1992).

The dermal absorbed dose for inorganic chemicals is estimated using a steady-state approach (USEPA 2004, Equation 3.4) and for organic chemicals is estimated using a nonsteady-state approach (USEPA 2004, Equations 3.2 and 3.3).

Attachment 6

Table 3:

Dispersion Factor to Outdoor Air

Philadelphia Energy Solutions Refining & Marketing LLC (PESRM) Philadelphia Refining Complex, Philadelphia, Pennsylvania

Parameter	Units	Value
Correlation coefficient city		Philadelphia
Correlation coefficient A		14.0111
Correlation coefficient B		19.6154
Correlation coefficient C		225.3397

Source area	acres	0.0008
Groundwater averaging time for C/Q		1-Hour Max
C/Q	$(L/m^3)/(L/m^2-s)$	15.83

Note:

C/Q is estimated using the empirical correlation in USEPA's (2002) Supplemental Soil Screening Guidance.

Notes:

f_{oral} and f_{inh} are the fraction of the oral and inhalation toxicity values, respectively, that USEPA identified as having a mutagenic mode of action.

Cancer RBSLs are calculated at a target cancer risk of 1E-05.

Notes:

- All concentrations reported in mg/kg (ppm); detection limits in parentheses.
- Only compounds with at least one detection are shown.
- D is an unknown qualifier.
- Boldfaced concentrations exceed the Routine Worker Soil Direct Contact.
- Underlined concentrations exceed the Routine Worker Soil VI.
- Italicized concentrations exceed the Construction Worker Soil Direct Contact.
- Grey shaded concentrations exceed the Soil Migration to GW.

Abbreviations:

- ND - Not Detected
NA - Not Analyzed
J - Estimated Concentration

Notes:

- All concentrations reported in mg/L; detection limits in parentheses.
- Only compounds with at least one detection are shown.
- Boldfaced concentrations exceed the Nonpotable GW Use.
- No concentrations exceed the Routine Worker GW Vol to Outdoor Air.
- Underlined concentrations exceed the Routine Worker GW VI.
- Italicized concentrations exceed the Construction Worker GW Direct Contact.
- Grey shaded concentrations exceed the Off-Site Resident GW VI.
- No concentrations exceed the GW Migration to SW.

Abbreviations:

- ND - Not Detected
- NA - Not Analyzed
- J - Estimated Concentration

GENERALIZED LITHOLOGY GRAPHICS

	Fill		Sand (incl. trace to little silt/clay/gravel)		Mud
	Sandy Gravel		Muddy Sand		Bedrock (incl. saprolite where indicated)
	Gravelly Sand		Sand with Lignite		

Notes:

1. Land surface profile obtained from a 2010 light detection and ranging (LIDAR) elevation model available from the United States Geological Survey (USGS).
2. Lithologic logs for borings PH-55, PH-41, B-11, B-7, B-4, B-1 and PH-30 were obtained from Tables 13 and 14 of Greenman et al., 1991. Geographic locations for those historic borings were estimated by Stantec in a GIS using a georeferenced image of Plate 1 of that report. Fill thickness interpreted by Stantec.
3. PH-25 terminal boring depth deeper than shown.
4. Water depths for the Schuylkill River were estimated using soundings provided on the National Oceanic and Atmospheric Administration (NOAA) navigation chart for the Delaware River, Philadelphia and Camden Waterfronts (Chart 12313). Mean lower low water (MLLW) depths were transformed to the North American Vertical Datum of 1988 (NAVD 88).
5. Stantec generalized lithologic data from available borehole logs into 8 categories as indicated for interpretive purposes.
6. Correlation between lithologies and, where applicable, geologic units is based on the straight-line method. Actual conditions between boreholes may vary from what is shown on this profile. Contacts dashed where inferred.
7. Vertical Exaggeration - 45 X

**Re: Philadelphia Energy Solutions Refining and Marketing, LLC (PES)
 PADEP Storage Tanks Registration/Permitting Application Form
 PADEP Facility ID #51-33624 – Girard Process Area**

To whom it may concern:

Please find NorthStar Contracting Group, Inc.'s submittal of the Pennsylvania Department of Environmental Protection's (PA DEP's) Storage Tank Registration/Permitting Application Form(s) for the removal of the following Five (5) Aboveground storage tank(s) located at the Philadelphia Energy Solutions Refining and Marketing, LLC Girard Point Processing Area.

Removed					
Facility Name	PADEP Facility ID #	PADEP Tank ID #	Owner Tank ID #	AMS Tank ID #	Removal Date
Girard Point Proc Area	51-33624	011A	GP-1047	N/A	07/06/2022
Girard Point Proc Area	51-33624	047A	GP-1101	P-137 (GP)	07/07/2022
Girard point Proc Area	51-33624	046A	GP-767	P-135 (GP)	07/08/2022
Girard point Proc Area	51-33624	044A	GP-894	N/A	07/11/2022
Girard point Proc Area	51-33624	033A	GP-1088	N/A	07/08/2022

If you have any questions, please do not hesitate to contact me at 440-228-1524.
 Respectfully Submitted,

Robert Armstrong
 Sr. Project Manager
 NorthStar Contracting Group, Inc.

Enclosures: Storage Tank Registration/Permitting Application Form

Mike Leonardo (Hilco)

STORAGE TANKS REGISTRATION / PERMITTING APPLICATION FORM

Before completing this form, read the step-by-step instructions provided in this application package.

51-33624 Facility ID # Phila Ref Girard Point Facility Name	DEP USE ONLY <hr/> Client ID# <hr/> Site ID# <hr/> Account # <hr/> Auth ID# <hr/> APS ID# <hr/> Master Auth ID#
--	--

I. PURPOSE OF SUBMITTAL

INITIAL (Applies to First-Time Facility Registration)

- | | |
|---|--|
| <input type="checkbox"/> Register Tank(s) to be Used* | <input type="checkbox"/> Register Tank(s) to be Temporarily Out of Use |
| <input type="checkbox"/> Register Tank(s) to be Removed | <input type="checkbox"/> Register Tank(s) to be Closed in Place |

AMENDED (Applies to Currently Registered Tank(s) or Existing Facility)

- | | |
|--|---|
| <input type="checkbox"/> Changed Owner Information | <input type="checkbox"/> Changed Contact Information |
| <input type="checkbox"/> Changed Facility Information | <input type="checkbox"/> Changed Facility Operator Information |
| <input type="checkbox"/> Changed to Currently In Use Tank(s)* | <input type="checkbox"/> Added Tank(s) to Existing Facility* |
| <input type="checkbox"/> Changed to Temporarily Out of Use Tank(s) | <input checked="" type="checkbox"/> Changed to Permanently Closed Tank(s)/Removed |
| <input type="checkbox"/> Changed Product | <input type="checkbox"/> Changed to Exempt Tank(s) |

CHANGE OF OWNERSHIP

- Tanks Changed Ownership and Remain at Same Facility*

* For Underground Storage Tanks (UST), attach the UST Operator Training Documentation Form (2630-PM-BECB0514a) and copies of the Class A and Class B operator training certificates.

X. INSTALLER / REMOVER CERTIFICATION

This section must be completed by the certified tank handler(s) who is responsible for the installation or removal from service of the aboveground and underground storage tank systems listed in Section VI, Tank modification activity must be submitted on a "Tank Modification Report" form.

SIGNATURE & CERTIFICATION OF INSTALLER(S) / REMOVER(S)

As the certified tank handler responsible for the tank handling activities in the category or categories listed, I certify that all tank handling activities were conducted in compliance with the design, installation and operation standards of the Storage Tank and Spill Prevention Act of 1989 and all applicable regulations. I also certify, under penalty of law as provided in 18 PA C.S.A. 4904 (relating to unsworn falsification to authorities), that the information provided herein is true, accurate and complete to the best of my knowledge and belief.

Tank#	Installer/Remover Name	Construction Standard	Individual Certification#	Certification Category	Company Certification#	Installer/Remover Signature	Date
011A	Brian Garner	API 650	5341	AFMX	1631		7/20/22
47A	Brian Garner	API 650	5341	AFMX	1631		7/20/22
46A	Brian Garner	API 12C	5341	AFMX	1631		7/20/22
44A	Brian Garner	API 12C	5341	AFMX	1631		7/20/22
033A	Brian Garner	API 12C	5431	AFMX	1631		7/26/22

XI. INSPECTOR CERTIFICATION

This section must be completed by the DEP Certified Tank Inspector(s) who is responsible for verifying the installation standards for field constructed tanks and aboveground tanks greater than 21,000 gallons listed in Section VI, (Type or Prod legibly). A DEP Certified Inspector may also be responsible for inspecting existing ASTs which are entering regulated service for the first time with no tank handling activities.

SIGNATURE & CERTIFICATION OF INSPECTOR(S)

As the certified tank inspector responsible for verifying tank handling activities and construction standards, I certify that the tank(s) listed below are constructed to appropriate industry standards and, if applicable, to manufacturer's specifications; that the tank(s) have been tested as required by industry standards; and that the tank(s) meet or exceed applicable design and operating standards; and are in compliance with the requirements of the Storage Tank and Spill Prevention Act of 1989, and all applicable regulations. I also certify under penalty of law as provided in 18 PA C.S.A. 4904 (relating to unsworn falsification to authorities), that the information provided herein is true, accurate and complete to the best of my knowledge and belief.

Tank#	Inspector Name	Construction Standard	Individual Certification#	Certification Category	Company Certification#	Inspector Signature	Date

XII. SITE SPECIFIC INSTALLATION PERMIT NUMBER

If a site-specific permit was required for a new tank installation, write the tank number(s) and permit number(s) in the appropriate box.

Re: Philadelphia Energy Solutions Refining and Marketing, LLC (PES)
 PADEP Storage Tanks Registration/Permitting Application Form
 PADEP Facility ID #51-53624 - Girard Point Refinery

To whom it may concern:

Please find NorthStar Contracting Group, Inc.'s submittal of the Pennsylvania Department of Environmental Protection's (PADEP's) Storage Tank Registration/Permitting Application Form for the removal of the following one (1) aboveground storage tanks located at the Philadelphia Energy Solutions Refining and Marketing, LLC Girard Point site.

Removed					
Facility Name	PADEP Facility ID #	PADEP Tank ID #	Owner Tank ID #	AMS Tank ID #	Removal Date
Girard Point Refinery	51-53624	019A	GIP-494	P-039	04/14/2012

If you have any questions, please do not hesitate to contact me at 440-228-1524.

Respectfully Submitted,

Robert Armstrong
 Sr. Project Manager
 NorthStar Contracting Group, Inc.
 Enclosures: Storage Tank Registration/Permitting Application Form

VIII. ABOVEGROUND & UNDERGROUND TANK INFORMATION FOR PERMANENT CLOSURE

Write the Tank Number(s) and place an in the appropriate box for each tank that was removed or closed in place.

Items 2 & 3 below apply to large ASTs and all USTs	Tank #	Tank #	Tank #	Tank #	Tank #	Tank #
	029A					
1 Contamination suspected or observed and notification of contamination form was submitted to the appropriate DEP regional office.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2 Closure document submitted to the appropriate DEP regional office.	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Closure document kept on file by owner.	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

IX. OWNER CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this and all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. This registration is conditioned upon compliance with provisions of the Storage Tank and Spill Prevention Act of 1989, all applicable regulations, and with the requirements for obtaining and maintaining a permit required under this Act. I certify my responsibility for assuring the following permit requirements:

- Storage tank systems are in compliance with applicable administrative, technical and operational requirements as specified in Subchapter E for underground tanks or Subchapter F or G for aboveground tanks
- Tank handling and inspection activities are performed by an individual possessing DEP certification in the appropriate category as required in Subchapters A and B.
- Underground storage tanks meet the applicable financial responsibility requirements of Subchapter H (relating to financial responsibility requirements).
- A Spill Prevention Response (SPR) Plan must be submitted to the appropriate DEP regional office for facilities that have aboveground storage tanks where the total capacity of all aboveground tanks is greater than 21,000 gallons.
- Other state and local permits required for operation of the tank system have been attained

My signature represents to the Department that I own the storage tank(s) and am aware of the responsibilities and potential liabilities as an "owner" arising under the Storage Tank and Spill Prevention Act of 1989 and all applicable regulations. I am also advised that statements made on this registration is made subject to the penalties of 18 P.S. Section 4904 relating to unsworn falsification to authorities.

X. INSTALLER / REMOVER CERTIFICATION

This section must be completed by the certified tank handler(s) who is responsible for the installation or removal from service of the aboveground and underground storage tank systems listed in Section VI. Tank modification activity must be submitted on a "Tank Modification Report" form.

SIGNATURE & CERTIFICATION OF INSTALLER(S)/REMOVER(S)
As the certified tank handler responsible for the tank handling activities in the category or categories listed, I certify that all tank handling activities were conducted in compliance with the design, installation and operation standards of the Storage Tank and Spill Prevention Act of 1995 and all applicable regulations. I also certify under penalty of law as provided in 18 PA.C.S.A. 4904 (relating to unsworn falsification to authorities), that the information provided therein is true, accurate and complete to the best of my knowledge and belief.

Tank#	Installer/Remover Name	Construction Standard	Individual Certification#	Certification Category	Company Certification#	Installer/Remover Signature	Date
029A	Brian Gomer	API 650	5341	AFMX	1631		5/5/2020

XI. INSPECTOR CERTIFICATION

This section must be completed by the DEP Certified Tank Inspector(s) who is responsible for verifying the installation standards for field constructed tanks and aboveground tanks greater than 21,000 gallons listed in Section VI. (Type or Print Legibly) A DEP Certified Inspector may also be responsible for inspecting existing ASTs which are entering regulated service for the first time with no tank handling activities.

SIGNATURE & CERTIFICATION OF INSPECTOR(S)

As the certified tank inspector responsible for verifying tank handling activities and construction standards, I certify that the tank(s) listed below are constructed to appropriate industry standards and, if applicable, to manufacturer's specifications, that the tank(s) have been leased as required by industry standards, and that the tank(s) meet or exceed applicable design and operating standards and are in compliance with the requirements of the Storage Tank and Spill Prevention Act of 1995, and all applicable regulations. I also certify under penalty of law as provided in 18 PA.C.S.A. 4904 (relating to unsworn falsification to authorities), that the information provided therein is true accurate and complete to the best of my knowledge and belief.

**Subject: Philadelphia Energy Solutions Refining and Marketing, L.L.C (PES)
PADEP Storage Tanks Registration/Permitting Application Form
PADEP Facility ID #51-33624 - Girard Point Refinery**

Dear PADEP:

On behalf of our client, JD2 Environmental, Inc. (JD2) is attaching the Pennsylvania Department of Environmental Protection's (PADEP's) Storage Tanks Registration/Permitting Application Form for the removal of the following aboveground storage tanks (ASTs):

Facility Name	PADEP Facility ID #	PADEP Tank ID #	Owner Tank ID #	AMS Tank ID #	Removal Date
Girard Point Refinery	51-33624	005A	GP 1117	P-024	10/4/2021
Girard Point Refinery	51-33624	030A	GP 1116	P-001	10/4/2021

If you have any questions regarding this submittal, please do not hesitate to contact me at (610) 430-8151.

Sincerely yours,

JD2 ENVIRONMENTAL, INC.

Kristian Satterthwaite
Environmental Scientist
PADEP Inspector #5081

V. CHANGE OF OWNERSHIP INFORMATION

- All Tanks Changed Ownership at the Facility
- Some Tanks Changed Ownership at the Facility (List all applicable tank numbers in Section VI.)

OWNERSHIP CHANGE TO - Client information is noted in Section II.
OWNERSHIP CHANGE FROM (previous owner information)

Name _____
Employer ID# (EIN) or SSN _____
Mailing Address Line 1 _____
Mailing Address Line 2 _____
Address Last Line - City _____ State _____ ZIP+4 _____
Previous Facility ID# _____

DATE OF SALE/TRANSFER

SIGNATURE & CERTIFICATION OF PREVIOUS OWNER

Previous owner's signature is not available. As required, the "new" owner has attached a deed of transfer or other proof of ownership to this application. Yes No N/A

I have reviewed this form for submission to the Department. I certify under penalty of law as provided in 18 PA. C.S.A. §4903 (relating to false swearing) and 18 PA. C.S.A. §4904 (relating to unsworn falsification to authorities), that I have the authority to sign this Section for the transfer of permit or registration for the storage tanks listed herein. Further, I certify that all information provided in Section V is true, accurate and complete to the best of my knowledge and belief.

Type or Print Previous Owner Name _____

Previous Owner Signature _____ Title _____ Date _____

Facility ID# 51-33624

Facility Name Phula Ref Girard Point

VI. STORAGE DESCRIPTION

Type or print legibly each regulated storage tank at this facility under your ownership.

Status Codes: C-Currently in Use T-Temporarily Out of Use E-Exempt
Type Codes: M-Manufactured F-Field Constructed P-Closed In Place

A. ABOVEGROUND TANKS. List all new tanks. If amending information, list only those tanks being amended. Copy this page if more lines are needed.

Tank#	Prev Status	New Status	Type	Install Date (Mo/Day/Yr)	Change of Status Date (Mo/Day/Yr)	Capacity (Gallons)	Substance Code (Currently or Last Stored)	CERCLA Name		Exempt Reference Code

VIII. ABOVEGROUND & UNDERGROUND TANK INFORMATION FOR PERMANENT CLOSURE

Write the Tank Number(s) and place an in the appropriate box for each tank that was removed or closed in place.

Items 2 & 3 below apply to large ASTs and all USTs	Tank #	Tank #	Tank #	Tank #	Tank #	Tank #
	005A	030A				
1. Contamination suspected or observed and notification of contamination form was submitted to the appropriate DEP regional office.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Closure document submitted to the appropriate DEP regional office.	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Closure document kept on file by owner.	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

IX. OWNER CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this and all attached documents, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. This registration is conditioned upon compliance with provisions of the Storage Tank and Spill Prevention Act of 1980, all applicable regulations, and with the requirements for obtaining and maintaining a permit required under this Act. I certify my responsibility for assuring the following permit requirements:

- Storage tank systems are in compliance with applicable administrative, technical and operational requirements as specified in Subchapter E for underground tanks or Subchapter F or G for aboveground tanks.
- Tank handling and inspection activities are performed by an individual possessing DEP certification in the appropriate category as required in Subchapters A and B.
- Underground storage tanks meet the applicable financial responsibility requirements of Subchapter H (relating to financial responsibility requirements).
- A Spill Prevention Response (SPR) Plan must be submitted to the appropriate DEP regional office for facilities that have aboveground storage tanks where the total capacity of all aboveground tanks is greater than 21,000 gallons.
- Other state and local permits required for operation of the tank system have been obtained.

My signature represents to the Department that I own the storage tank(s) and am aware of the responsibilities and potential liabilities as an "owner" arising under the Storage Tank and Spill Prevention Act of 1980 and all applicable regulations. I am also advised that statements made on this registration is made subject to the penalties of 18 PA. C.S.A. Section 4904 relating to unsworn falsification to authorities.

Type or Print Owner Name Gary Bowman

	President Title	11/01/2021 Date

X. INSTALLER / REMOVER CERTIFICATION

This section must be completed by the certified tank handler(s) who is responsible for the installation or removal of the aboveground and underground storage tank systems listed in Section VI. Tank modification activity must be submitted on a "Tank Modification Report" form.

SIGNATURE & CERTIFICATION OF INSTALLER(S) / REMOVER(S)

As the certified tank handler responsible for the tank handling activities in this category or categories listed, I certify that all tank handling activities were conducted in compliance with the design, installation and operation standards of the Storage Tank and Spill Prevention Act of 1989 and all applicable regulations. I also certify, under penalty of law as provided in 18 PA C.S.A. 4904 (relating to unsworn falsification to authorities), that the information provided herein is true, accurate and complete to the best of my knowledge and belief.

Tank#	Installer/Remover Name	Construction Standard	Individual Certifications	Certification Category	Company Certifications	Installer/Remover Signature	Date
005A	Kristian Sutherthwaite		588f	AFR	1567	<i>Kristian Sutherthwaite</i>	11/28/21
030A	Kristian Sutherthwaite		588f	AFR	1567	<i>Kristian Sutherthwaite</i>	11/29/21

XI. INSPECTOR CERTIFICATION

This section must be completed by the DEP Certified Tank Inspector(s) who is responsible for verifying the installation standards for field constructed tanks and aboveground tanks greater than 21,000 gallons listed in Section VI. (Type or Print legibly) A DEP Certified Inspector may also be responsible for inspecting existing ASTs which are entering regulated service for the first time with no tank handling activities.

SIGNATURE & CERTIFICATION OF INSPECTOR(S)

As the certified tank inspector responsible for verifying tank handling activities and construction standards, I certify that the tank(s) listed below are constructed to appropriate industry standards and, if applicable, to manufacturer's specifications; that the tank(s) have been tested as required by industry standards; and that this tank(s) meet or exceed applicable design and operating standards; and are in compliance with the requirements of the Storage Tank and Spill Prevention Act of 1989, and all applicable regulations. I also certify under penalty of law as provided in 18 PA C.S.A. 4904 (relating to unsworn falsification to authorities), that the information provided herein is true, accurate and complete to the best of my knowledge and belief.

Enclosures Storage Tank Registration/Permitting Application Form

cc:

Gary Bowman (NorthStar)
Dr. Kassahun Selassie (AMS)
Thomas Darsley (AMS)
Clades Barksdale (Hilco)
Edward Wiener (AMS)
Mike Leonardo (Hilco)

STORAGE TANKS REGISTRATION / PERMITTING APPLICATION FORM

Before completing this form, read the step-by-step instructions provided in this application package.

61-33624 Facility ID # Philadelphia Ref Girard Point Facility Name	DEP USE ONLY Client ID# Site ID# Account # Auth ID# APB ID# Master Auth ID#
---	--

I. PURPOSE OF SUBMITTAL

INITIAL (Applies to First-Time Facility Registration)

- | | |
|--|---|
| <input type="checkbox"/> Register Tank(s) to be Used*
<input type="checkbox"/> Register Tank(s) to be Removed | <input type="checkbox"/> Register Tank(s) to be Temporarily Out of Use
<input type="checkbox"/> Register Tank(s) to be Closed in Place |
|--|---|

AMENDED (Applies to Currently Registered Tank(s) or Existing Facility)

- | | |
|--|---|
| <input type="checkbox"/> Changed Owner Information
<input type="checkbox"/> Changed Facility Information
<input type="checkbox"/> Changed to Currently In Use Tank(s)*
<input type="checkbox"/> Changed to Temporarily Out of Use Tank(s)
<input type="checkbox"/> Changed Product | <input type="checkbox"/> Changed Contact Information
<input type="checkbox"/> Changed Facility Operator Information
<input type="checkbox"/> Added Tank(s) to Existing Facility*
<input checked="" type="checkbox"/> Changed to Permanently Closed Tank(s)/Removed
<input type="checkbox"/> Changed to Exempt Tank(s) |
|--|---|

CHANGE OF OWNERSHIP

- Tanks Changed Ownership and Remain at Same Facility*

* For Underground Storage Tanks (UST), attach the UST Operator Training Documentation Form (2630-PM-BECB0514a) and copies of the Class A and Class B operator training certificates.

IX. OWNER CERTIFICATION

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this and all attached documents and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the submitted information is true, accurate, and complete. This registration is conditioned upon compliance with provisions of the Storage Tank and Spill Prevention Act of 1989, all applicable regulations, and with the requirements for obtaining and maintaining a permit required under this Act. I certify my responsibility for assuring the following permit requirements:

- Storage tank systems are in compliance with applicable administrative, technical and operational requirements as specified in Subchapter E for underground tanks or Subchapter F or G for aboveground tanks.
- Tank handling and inspection activities are performed by an individual possessing DEP certification in the appropriate category as required in Subchapters A and B.
- Underground storage tanks meet the applicable financial responsibility requirements of Subchapter H (relating to financial responsibility requirements).
- A Spill Prevention Response (SPR) Plan must be submitted to the appropriate DEP regional office for facilities that have aboveground storage tanks where the total capacity of all aboveground tanks is greater than 21,000 gallons.
- Other state and local permits required for operation of the tank system have been obtained.

My signature represents to the Department that I own the storage tank(s) and am aware of the responsibilities and potential liabilities as an "owner" arising under the Storage Tank and Spill Prevention Act of 1989 and all applicable regulations. I am also advised that statements made on this registration is made subject to the penalties of 18 PA. C.S.A. Section 4904 relating to unsworn falsification to authorities.

X. INSTALLER / REMOVER CERTIFICATION

This section must be completed by the certified tank handler(s) who is responsible for the installation or removal from service of the aboveground and underground storage tank systems listed in Section VI. Tank modification activity must be submitted on a "Tank Modification Report" form.

SIGNATURE & CERTIFICATION OF INSTALLER(S) / REMOVER(S)

As the certified tank handler responsible for the tank handling activities in the category or categories listed, I certify that all tank handling activities were conducted in compliance with the design, installation and operation standards of the Storage Tank and Spill Prevention Act of 1989 and all applicable regulations. I also certify, under penalty of law as provided in 18 PA C.S.A. 4304 (relating to unsworn falsification to authorities), that the information provided herein is true, accurate and complete to the best of my knowledge and belief.

Tank#	Installer/Remover Name	Construction Standard	Individual Certification#	Certification Category	Company Certification#	Installer/Remover Signature	Date

XI. INSPECTOR CERTIFICATION

This section must be completed by the DEP Certified Tank Inspector(s) who is responsible for verifying the installer standards for both constructed tanks and aboveground tanks greater than 21,000 gallons listed in Section VI. (Type or Print legibly) A DEP Certified Inspector may also be responsible for inspecting existing ASTs which are entering regulated service for the first time with no tank handling activities.

SIGNATURE & CERTIFICATION OF INSPECTOR(S)

As the certified tank inspector responsible for verifying tank handling activities and construction standards, I certify that the tank(s) listed below are constructed to appropriate industry standards and, if applicable, to manufacturer's specifications; that the tank(s) have been tested as required by industry standards; and that the tank(s) meet or exceed applicable design and operating standards; and are in compliance with the requirements of the Storage Tank and Spill Prevention Act of 1989, and all applicable regulations. I also certify under penalty of law as provided in 18 PA C.S.A. 4304 (relating to unsworn falsification to authorities), that the information provided herein is true, accurate and complete to the best of my knowledge and belief.

**ABOVEGROUND STORAGE TANK SYSTEM
CLOSURE REPORT FORM**

Owners who are permanently closing aboveground storage tank systems may use this form to demonstrate that a storage tank system closure was performed in accordance with technical guidance document 263-4200-001 "Closure Requirements for Aboveground Storage Tank Systems". PLEASE PRINT OR TYPE. COMPLETE ALL QUESTIONS.

SECTION I. Owner/Facility/Tank/Waste Management and Disposal Information

1. Facility ID Number 51-33624
2. Facility Name Former Philadelphia Refinery Point Breeze - Tank Group 7
3. Facility County Philadelphia
4. Facility Municipality Philadelphia
5. Facility Address 3144 West Passyunk Avenue
6. Facility Contact Person Anne R. Garr
7. Facility Telephone Number (312) 796-6564
8. Owner Name Philadelphia Energy Solutions Refining and Marketing LLC
9. Owner Mailing Address 111 S. Wacker Dr., Ste 3000
10. Description of Aboveground Storage Tank Systems (Complete for each tank system closed)

DATE OF TANK SYSTEM CLOSURE (Month/Day/Year)		-	-	-	-
Description of Aboveground Storage Tank System (Complete for each tank system undergoing closure)

	c. Change-in-Service		<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Describe Closure Activities:

The tanks were drained via the in-place piping systems. Associated piping was also drained. Residual product was retained for use in other areas of the Former Philadelphia Refinery Complex. The interiors of tanks were cleaned. The tanks and piping were dismantled and removed from the site for disposal. When encountered, double bottoms were excavated and removed at a later date.

Yes N/A

11. Briefly describe the storage tank facility and the nature of the operations which were conducted at the facility (both historical and present) **including use of the storage tank systems:**

Tank Group 07 was located in the south-central portion of the Former Philadelphia Refinery Complex.

The tanks in the group held a variety of materials associated with the petroleum refining process.

12. A site location and sampling map of the site, drawn to scale, is attached. See page 11 of 11.
13. Original, color photographs of the closure process involving any excavation are attached (i.e., inside of excavation/piping runs, pit water, containment structure and foundation showing condition).
14. An amended "Storage Tanks Registration/Permitting Application" Form was submitted to the DEP, Bureau of Environmental Cleanup and Brownfields, Division of Storage Tanks, P.O. Box 8762, Harrisburg, PA 17105-8762.

Date: 10 / 4 / 2021

15. If a release was confirmed, the appropriate regional office of DEP was notified by the owner or operator.

Date: 8 / 10 / 2022

Office: Southeast

Yes N/A

16. If tanks were cleaned on-site:
- a. Briefly describe the disposition of usable product: Usable product was drained from the tanks prior to cleaning. Any residual product was discharged to the on-site process sewer and wastewater treatment system.
- b. Briefly describe the disposal of unusable product, sludges, sediments, and wastewater generated during cleaning. Provide the name and permit number of the processing, treatment, storage or disposal facility. (Attach documentation of proper disposal):
Tank Bottoms were stabilized prior to being transported offsite for disposal as hazardous secondary materials and shipped via railcar to Chemical Waster Management Inc at 7170 John Brannon Road, Sulphur, LA 70665. Remaining waste was discharged to the facility process sewer and wastewater treatment system.
- c. If tank contents were determined/deemed to be hazardous waste, provide:
- (1) Generator ID Number: PAD 04979109
- (2) Licensed Hazardous Waste Transporter Name and ID Number: LA 0000777201, LA 000147272
17. If tanks were removed from the site for cleaning:
- a. Provide the name and permit number of the processing, treatment, storage or disposal facility performing the tank cleaning:
- b. If tank contents were determined/deemed to be hazardous waste, provide:
- (1) Generator ID Number: _____
- (2) Licensed Hazardous Waste Transporter Name and ID Number: _____
18. Briefly describe the disposition of tanks/piping (Attach documentation of proper disposal):
All tanks, associated piping were cleaned, demolished and recycled for scrap value.
19. If contaminated soil is excavated:
- a. Briefly describe the disposition and amount _____ (tons) of contaminated soil. Provide the name and permit number of the processing, treatment, storage or disposal facility. (Attach documentation of proper disposal):
- _____
- _____
- _____

- b. If contaminated soil is determined/deemed to be hazardous waste, provide:
- (1) Generator ID Number: _____
 - (2) Licensed Hazardous Waste Transporter Name and ID Number: _____

Yes N/A

 20. Briefly describe the disposition of and amount _____ (tons) of uncontaminated soil and debris (attach analyses):

21. If the tanks were "Closed-in-Place" provide information below:
- a. Briefly describe the tank cleaning process: _____

 - b. If subcontracted, name and address of company that performed the tank cleaning:

 - c. How were tanks marked/labeled with permanent closure date: _____

I, Anne R. Garr, Assistant Secretary, hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn falsification to authorities) that I am the owner of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section I) is true, accurate and complete to the best of my knowledge and belief.

Title

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION II. Tank Handling Information

Facility ID Number 51 - 33624

DEP Tank ID Number(s) 005A, 006A, 007A, 029A, 030A, 033A, 034A, 035A, 036A, 037A, 039A, 046A

Yes N/A

1. Briefly describe the excavation and initial on-site staging of uncontaminated/contaminated soil and debris:
Removed tank and piping debris was segregated and loaded into roll-off containers during demolition.

2. Briefly describe the method of piping system closure and the closure of the piping systems including the quantity and condition of the piping:

3. Briefly describe the condition of the tanks and any problems encountered during tank handling or tank removal activities:

4. Briefly describe the method used to purge the tanks of and monitor for hazardous or explosive vapors:

5. If tanks were cleaned on-site:
a. Briefly describe the tank cleaning process: Tanks were drained, cut open, rinsed and scrubbed clean of any residuals before demolition.

b. If subcontracted, name and address of company that performed the tank cleaning:
NorthStar Contracting Group, Inc., 2250 East Adams Avenue, Philadelphia, PA 19124

6. If tanks were "Closed-in-Place", briefly describe how tanks were rendered inoperative, marked permanently closed with date, vented and secured to prevent unauthorized entry: _____

7. If contamination was suspected or observed, the "Notification of Contamination" form was submitted.

I, KRISTIAN SATTERTHWAITE hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to
(Print Name)
unsworn falsification to authorities) that I am the certified remover who performed the tank handling activities associated
with the closure of the above referenced storage tank(s) and that the information provided by me in this closure report
(Section I) is true, accurate and complete to the best of my knowledge and belief.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 029A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

A. Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).

Bedrock N/A feet below land surface Water 15 feet below land surface

B. Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).

Length of piping N/A feet

C. TANK SYSTEM REMOVED FROM THE GROUND/SITE

1). Was obvious contamination observed while excavating, sampling or removing the tank system?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.

2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?

YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.

D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE

Was obvious contamination observed during sampling, boring or assessing water depths?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ Continue with corrective action -----> See end of this section for options on submission and maintenance of closure records.

E. If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

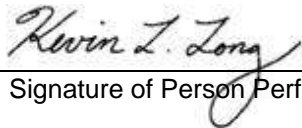

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn (Print Name) falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

¹ Where EPA Method 5035 is used, indicate sample collection option in the right-hand box of this column using the following codes:

- P - Samples placed in a soil sample vial with a preservative present.
- E - Samples collected and stored in a soil collection device which is airtight and affords little to no headspace.

N - Samples placed in soil sample vial without a preservative present.

Site Location and Sampling Map - Use this page or suitable facsimile to provide a large-scale map of the site where storage tank systems were closed. Scales between 1" = 10 and 1" = 100 feet frequently work well. Include the following information as each applies to the site: facility name and I.D., county, township or borough, property boundaries or area of interest, buildings, roads and streets with names or route numbers, utilities, location and ID number of storage tank systems removed including piping and dispensers, soil stockpile locations, excavations or other locations of product recovery, north arrow, approximate map scale and legend. Also, show depth and location of samples with sample ID numbers cross-referenced to the same ID numbers shown on Page 10 of 11.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 046A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

A. Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).

Bedrock N/A feet below land surface Water 15 feet below land surface

B. Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).

Length of piping N/A feet

C. TANK SYSTEM REMOVED FROM THE GROUND/SITE

1). Was obvious contamination observed while excavating, sampling or removing the tank system?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.

2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?

YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.

D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE

Was obvious contamination observed during sampling, boring or assessing water depths?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ Continue with corrective action -----> See end of this section for options on submission and maintenance of closure records.

E. If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

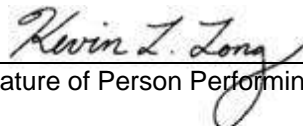

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn (Print Name) falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

Signature of Person Performing Site Assessment

2 / 1 / 2023

Date

Principal Consultant

Title of Person Performing Site Assessment

Terraphase Engineering, Inc.

Name of Company Performing Site Assessment

609-236-8171 x93

Telephone Number of Person Performing Site Assessment

N - Samples placed in soil sample vial without a preservative present.

Site Location and Sampling Map - Use this page or suitable facsimile to provide a large-scale map of the site where storage tank systems were closed. Scales between 1" = 10 and 1" = 100 feet frequently work well. Include the following information as each applies to the site: facility name and I.D., county, township or borough, property boundaries or area of interest, buildings, roads and streets with names or route numbers, utilities, location and ID number of storage tank systems removed including piping and dispensers, soil stockpile locations, excavations or other locations of product recovery, north arrow, approximate map scale and legend. Also, show depth and location of samples with sample ID numbers cross-referenced to the same ID numbers shown on Page 10 of 11.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 034A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

A. Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).

Bedrock N/A feet below land surface Water 15 feet below land surface

B. Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).

Length of piping N/A feet

C. TANK SYSTEM REMOVED FROM THE GROUND/SITE

1). Was obvious contamination observed while excavating, sampling or removing the tank system?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.

2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?

YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.

D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE

Was obvious contamination observed during sampling, boring or assessing water depths?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

Continue with corrective action -----> See end of this section for options on submission and maintenance of closure records.

E. If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 036A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

A. Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).

Bedrock N/A feet below land surface Water 15 feet below land surface

B. Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).

Length of piping N/A feet

C. TANK SYSTEM REMOVED FROM THE GROUND/SITE

1). Was obvious contamination observed while excavating, sampling or removing the tank system?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.

2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?

YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.

D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE

Was obvious contamination observed during sampling, boring or assessing water depths?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

Continue with corrective action -----> See end of this section for options on submission and maintenance of closure records.

E. If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

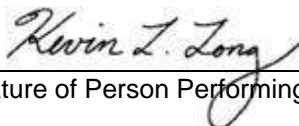

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

N - Samples placed in soil sample vial without a preservative present.

Site Location and Sampling Map - Use this page or suitable facsimile to provide a large-scale map of the site where storage tank systems were closed. Scales between 1" = 10 and 1" = 100 feet frequently work well. Include the following information as each applies to the site: facility name and I.D., county, township or borough, property boundaries or area of interest, buildings, roads and streets with names or route numbers, utilities, location and ID number of storage tank systems removed including piping and dispensers, soil stockpile locations, excavations or other locations of product recovery, north arrow, approximate map scale and legend. Also, show depth and location of samples with sample ID numbers cross-referenced to the same ID numbers shown on Page 10 of 11.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 037A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

- A.** Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).
Bedrock N/A feet below land surface Water 15 feet below land surface
- B.** Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).
Length of piping N/A feet
- C. TANK SYSTEM REMOVED FROM THE GROUND/SITE**
- 1). Was obvious contamination observed while excavating, sampling or removing the tank system?
 NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.
 YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.
- 2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?
 YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.
 NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.
- D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE**
- Was obvious contamination observed during sampling, boring or assessing water depths?
 NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.
 YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> See end of this section for options on submission and maintenance of closure records.
- E.** If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

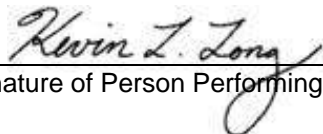

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn (Print Name) falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 007A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

A. Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).

Bedrock N/A feet below land surface Water 15 feet below land surface

B. Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).

Length of piping N/A feet

C. TANK SYSTEM REMOVED FROM THE GROUND/SITE

1). Was obvious contamination observed while excavating, sampling or removing the tank system?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.

2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?

YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.

D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE

Was obvious contamination observed during sampling, boring or assessing water depths?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ Continue with corrective action -----> See end of this section for options on submission and maintenance of closure records.

E. If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

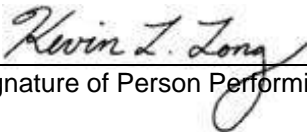

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 030A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

- A.** Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).
Bedrock N/A feet below land surface Water 15 feet below land surface
- B.** Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).
Length of piping N/A feet
- C. TANK SYSTEM REMOVED FROM THE GROUND/SITE**
- 1). Was obvious contamination observed while excavating, sampling or removing the tank system?
 NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.
 YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.
- 2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?
 YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.
 NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.
- D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE**
- Was obvious contamination observed during sampling, boring or assessing water depths?
 NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.
 YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> See end of this section for options on submission and maintenance of closure records.
- E.** If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

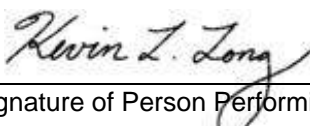

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

Signature of Person Performing Site Assessment

Title of Person Performing Site Assessment

Terraphase Engineering, Inc.
Name of Company Performing Site Assessment

609-236-8171 x93
Telephone Number of Person Performing Site Assessment

N - Samples placed in soil sample vial without a preservative present.

Site Location and Sampling Map - Use this page or suitable facsimile to provide a large-scale map of the site where storage tank systems were closed. Scales between 1" = 10 and 1" = 100 feet frequently work well. Include the following information as each applies to the site: facility name and I.D., county, township or borough, property boundaries or area of interest, buildings, roads and streets with names or route numbers, utilities, location and ID number of storage tank systems removed including piping and dispensers, soil stockpile locations, excavations or other locations of product recovery, north arrow, approximate map scale and legend. Also, show depth and location of samples with sample ID numbers cross-referenced to the same ID numbers shown on Page 10 of 11.

ABOVEGROUND STORAGE TANK SYSTEM CLOSURE REPORT FORM

SECTION III. Site Assessment Information

Tank Registration # 005A (complete one sheet for EACH tank system and attach ALL laboratory sheets pertaining to that system)

Facility ID Number 51 - 33624

A. Provide depth of *BEDROCK* and *WATER* IF encountered during excavation or soil boring (write "N/A": if NOT encountered).

Bedrock N/A feet below land surface Water 15 feet below land surface

B. Provide Length of *PIPING* IF piping was closed-in-place (write "N/A" if NOT closed-in-place).

Length of piping N/A feet

C. TANK SYSTEM REMOVED FROM THE GROUND/SITE

1). Was obvious contamination observed while excavating, sampling or removing the tank system?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records -----> Do not complete item C.2. below.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ -----> Complete item C.2. below.

2). Was contamination localized (within three feet of the tank system in every direction with no obvious water contamination)?

YES -----> Remove or remediate contaminated soil -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

NO -----> Continue Interim Remedial Actions -----> See end of this section for options on submission and maintenance of closure records.

D. TANK SYSTEM CLOSED-IN-PLACE OR CHANGED-IN-SERVICE

Was obvious contamination observed during sampling, boring or assessing water depths?

NO -----> Conduct confirmatory sampling -----> See end of this section for options on submission and maintenance of closure records.

YES -----> Report release to DEP within 24 hours -----> Describe contamination observed and likely source(s) (tank, piping, dispenser, spills, overfills): _____

_____ Continue with corrective action -----> See end of this section for options on submission and maintenance of closure records.

E. If the answer to C.1. is "no", the answer to C.2. is "yes" or the answer to D. is "no", confirmatory samples are required. Use the sample/analysis information sheet on page 10 of 11 to provide the information on confirmatory sampling and complete the diagram on Page 11 of 11.

Options for Submission and Maintenance of Closure Site Assessment Records

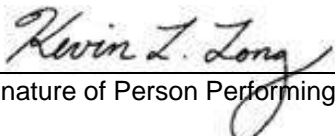

Records of the site assessment must be maintained for at least three years after completion of permanent closure or change-in-service in one of the following ways:

- (a) By the owners and operators who took the tank system out of service;
- (b) By the current owners and operators of the tank system site; or
- (c) By mailing these records to the DEP regional office responsible for the county in which the tank is located if they cannot be maintained at the closed facility.

Where the results of the site assessment indicate that obvious, localized soil contamination was encountered and the analytical results of the confirmatory sampling show levels below the statewide standard/action levels, this closure report form (Sections I, II, and III) or some other acceptable site characterization report must be received by the Department within 180 days of verbally reporting the release.

Where the results of the site assessment indicate that no obvious contamination or obvious, localized contamination was encountered, but the analytical results of the confirmatory sampling show levels above the statewide standard/action levels, or where there is obvious, extensive contamination, Section 245.310(a)(8) of the Corrective Action Process (CAP) regulations requires that details of removal from service be included in the site characterization report. A copy of the completed closure report form should be submitted as part of the site characterization report to satisfy the requirements of Section 245.310(a)(8) of the CAP regulations.

I, Kevin Long , hereby certify, under penalty of law as provided in 18 Pa. C.S. §4904 (relating to unsworn falsification to authorities) that I am the person who performed the site assessment activities associated with the closure of the above referenced storage tank system(s) and that the information provided by me in this closure report (Section III) is true, accurate and complete to the best of my knowledge and belief.

Signature of Person Performing Site Assessment

2 / 1 / 2023

Date

Principal Consultant

Title of Person Performing Site Assessment

Terraphase Engineering, Inc.

Name of Company Performing Site Assessment

609-236-8171 x93

Telephone Number of Person Performing Site Assessment

N - Samples placed in soil sample vial without a preservative present.

Site Location and Sampling Map - Use this page or suitable facsimile to provide a large-scale map of the site where storage tank systems were closed. Scales between 1" = 10 and 1" = 100 feet frequently work well. Include the following information as each applies to the site: facility name and I.D., county, township or borough, property boundaries or area of interest, buildings, roads and streets with names or route numbers, utilities, location and ID number of storage tank systems removed including piping and dispensers, soil stockpile locations, excavations or other locations of product recovery, north arrow, approximate map scale and legend. Also, show depth and location of samples with sample ID numbers cross-referenced to the same ID numbers shown on Page 10 of 11.

Product Movement and Waste Disposal Documentation (Tank 005A)

PES Project Load Ticket

#S12010 →

Load Ticket: 16330

Date: 09/29/21

Sold to: Medison Scrap
Location: Tanaka (111-11) 7
Carrier: Highway

Non-Haz / ACM / Special Waste

Activity Location: _____

Steel / Ferrous

- No. 1 P+S
- No. 2 Heavy Mill
- Cast Iron
- Mixed
- Pipe
- Light Iron
- Re-Bar
- Other: Tank Plate

- Non-Ferrous
- Insulated Copper Wire
 - No. 1 Copper Wire
 - Brass
 - Aluminum
 - Stainless, Grade _____
 - Other Alloy, Grade _____
 - Mixed
 - Other: _____

- Condition
- Prepared
 - Unprepared
 - Green Waste
 - Concrete
 - Masonry
 - Mixed Masonry
 - Wood Only
 - Demo Debris (C&D)
 - Dirt / Fill
 - Sand Fill
 - Crushed Stone
 - Other: _____

Waste Stream

- C&D Demolition Debris
- Non-Friable ACM
- Friable ACM
- PB WWTP Sludge
- GP WWTP Sludge
- Characteristic Haz Waste (flammable D001, corrosive D002, reactive D003, toxicity D004 -D043)
- Process Haz Waste
- Demo Debris (C&D)
- Non-Haz Waste (Solid)
- Non-Haz Waste (Liquid)
- PCB (Non-TSCA)
- PCB (TSCA)

Disposal Facility: _____

Carrier: _____

Truck #: _____

Container #: _____

Manifest #: _____

Profile / Approval #: _____

Scale Info

Scale Ticket #: _____

Gross Weight: _____

Tare weight: _____

Net weight: _____

Net Kilogram Conversion (PCB Only): _____

NorthStar Rep. Signature: _____

RECEIVED subject to the classifications and tariffs in effect on the date of the issue of this Bill of Lading, the property described above in apparent good order, except as noted (contents and condition of packages unknown), marked, consigned and described as indicated above which said carrier (the word carrier being understood through this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to the usual place of delivery as said destination. If on its route, otherwise to deliver to another carrier on the route to said destination, it is mutually agreed as to each carrier of all or any of said property, over all or any portion of said route to destination and as to each party of any time involved in all or any said property, that every service to be performed hereunder shall be subject to all the Bill of Lading terms and conditions in the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification and the said terms and conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC Carrier: CSX Railroad Corp.

Per: *[Signature]* Date: 7/15/21 Per: Luis Castro Date: 7/16/21

Mark with "X" or "RD" if appropriate to designate Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of the column is an optional method for identifying hazardous materials on Bills of Lading 172.201(a)(1) (D) of Title 49, Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's obligation determined prescribed in section 172.204(a) of the Federal Regulations, as indicated on the Bill of Lading does apply, unless a specific exemption from the requirement is provided in the Regulation for a particular material.

RECEIVED subject to the classifications and tariffs in effect on the date of the issue of this Bill of Lading, the property described above in apparent good order, except as noted (contents and condition of packages unknown), marked, consigned and delivered as indicated above which said carrier (the word carrier being understood through this contract to mean any person or corporation in possession of the property under the contract) agrees to carry to the usual place of delivery as indicated hereon. If on its route, otherwise to deliver in another carrier or thereafter to said destination, it is mutually agreed as to each carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to the Bill of Lading terms and conditions in the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification and the said terms and conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC Carrier: CSX Railroad Corp.

Per: *[Signature]* Date: 7/15/21 Per: *Luis Castro* Date: 7/16/21

Mark with "X" or "RD" if appropriate to designate Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this column is an optional method for identifying hazardous materials on Bills of Lading 172.201(a)(1)(ii) of the U.S. Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement prescribed in section 172.204(a) of the Federal Regulations, as indicated on the Bill of Lading does apply, unless a specific exception from the requirement is provided in the Regulation for a particular material.

RECEIVED subject to the classifications and limits in effect on the date of the issue of the Bill of Lading, the property described above in apparent good order, except as noted (contents and condition of packages unknown), marked, counted and distilled as indicated above which said carrier (the word carrier being understood through this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to the usual place of delivery or said destination. If only route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to all the Bill of Lading terms and conditions in the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification and the regulations and conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC
 Carrier: CSX Railroad Corp.
 Per: *[Signature]* Date: 7/23/21
 Per: Lucia Castro Date: 7/26/21

Mark with "X" or "HC" if applicable to designate Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this column is an optional method for designating hazardous materials on Bill of Lading 172.201(a)(1) (b) of Title 49, Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement prescribed in section 172.204(a) of the Federal Regulations, as indicated on the Bill of Lading does apply, unless a specific exception from the requirement is provided in the Regulation for a particular material.

RECEIVER: Subject to the classifications and labels in effect on the date of the issue of this Bill of Lading, the property described above an apparent good piece, except as noted (contents and condition of packages unknown), marked consigned and destined as indicated above which said carrier (the word carrier being understood through this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery as said destination. If on its route, otherwise to deliver in another carrier on the main to said destination, it is mutually agreed as in each carrier of all or any portion of said route to destination and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to all the Bill of Lading terms and conditions: the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification and the said terms and conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC

Carrier: CSX Railroad Corp

Per: *[Signature]* Date: 7/23/21 Per: *Luis Castro* Date: 7/26/21

Mark with "X" or "RC" if applicable designates Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this power is an optional method for identifying hazardous materials on Bills of Lading 172.201(a)(1) (b) of Title 49 Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement prescribed in section 172.204(a) of the Federal Regulations, as indicated on the Bill of Lading 000s apply, unless a specific exception from the requirement is provided in the Regulation for a particular material.

Mark with "X" or "RQ" as appropriate to designate Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this column is an optional method for identifying hazardous materials on Bills of Lading 172.201(a)(1) of Title 49, Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement prescribed in section 172.204(b) of the Federal Regulations, as indicated on the Bill of Lading does apply, unless a specific exception from the requirement is provided in the Regulation for a particular material.

RECEIVED subject to the classifications and tariffs in effect on the date of the issue of this Bill of Lading, the property described above in apparent good order, except as noted (contents and condition of packages unknown), marked, consigned and sealed as indicated above which said carrier (the word carrier being understood through this contract as bearing any duty or responsibility in possession of the property under the contract) agrees to carry to the usual place of delivery or its destination, if on his route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to all the Bill of Lading terms and conditions in the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification and the additional conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC	Carrier: CSX Transportation
Per: <i>[Signature]</i>	Date: 7/28/21
Per: <i>Luis Castro</i>	Date: 7/30/21

Mark with "X" or "RD" if applicable to designated Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this column is an optional method for identifying hazardous materials on Bills of Lading 172.221(a)(1) (B) of Title 49 Code of Federal Regulations. Also, when shipping infectious materials, the shipper's certification statement prescribed in section 172.204(a) of the Federal Regulations, as indicated on the Bill of Lading does apply, unless a specific exception from the requirement is provided in the Regulations for a particular material.

RECEIVED subject to the classifications and tariffs in effect on the date of the issue of this Bill of Lading, the property described above in apparent good order, except as noted (see 2211) and condition of packages unknown, marked, counted and delivered as indicated above which said carrier (the word carrier being understood through this contract as meaning any person or corporation in possession of the property under the caption) agrees to carry to the next place of delivery as said destination. If on its route, desiring to deliver to another carrier on the route to said destination it is mutually agreed as to each carrier of all or any of said property, over all or any portion of said route to destination and as to each party at any time hereafter in all or any said property, that every carrier to be performed hereunder shall be subject to all the Bill of Lading terms and conditions in the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification and the said terms and conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC
 Carrier: CSX Transportation
 Per: *[Signature]* Date: 7/29/21
 Per: Luis Castro Date: 7/30/21

Mark with "X" or "RC" as appropriate to indicate Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this column is an optional method for identifying hazardous materials on Bills of Lading 172.30(a)(1) (b) of Title 49 Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement prescribed in section 172.204(e) of the Federal Regulations, as indicated on this Bill of Lading does apply, unless a specific exception from the requirement is provided in the Regulation for a particular material.

Date:

7/30/21

Mark with "X" or "RC" if applicable to designate hazardous materials as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of UN numbers is an optional method for identifying hazardous materials on Bills of Lading 172.201(b)(1) (ii) of Title 49 Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement presented in Section 172.204(g) of the Federal Regulations, as indicated on the Bill of Lading, does not apply unless a specific exception from the requirement is provided in the Regulation for a particular material.

Designated Consignee: Chemical Waste Management, Inc

RECEIVED subject to the classification and labels in effect on the date of this Bill of Lading, the property described above is apparent gross weight, except as noted (contents and contents of packages unknown), marked, consigned and certified as indicated above which said owner, (the word carrier being understood through this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to the usual place of delivery or other destination, if on its route, otherwise to deliver to another carrier on the route to said destination, it is mutually agreed to each carrier of all or any of said property, over all or any portion of said route to destination and as to each party of any line interested in all or any said property, that every service to be performed hereunder shall be subject to all the Bill of Lading terms and conditions in the governing classification and the tariffs and conditions.

Shipper: PHILADELPHIA ENERGY SOLUTIONS R&M LLC Carrier: CSX Railroad Corp
 Per: *[Signature]* Date: 8/14/21 Per: Luis Castro Date: 8/16/21

Mark with "X" or "RC" if applicable to designate Hazardous Materials Substances as defined in the Department of Transportation Regulations governing the transportation of hazardous materials. The use of this option is an optional method for identifying hazardous materials on Bills of Lading 49 CFR 172.201(a)(1) (ii) of Title 49 Code of Federal Regulations. Also, when shipping hazardous materials, the shipper's certification statement prescribed in section 172.201(e) of the Federal Regulations, as indicated on the Bill of Lading does apply, unless a specific exception from the requirement is provided in the Regulation for a particular material.

RECEIVED subject to the classifications and tariffs in effect on the date of the issue of this Bill of Lading, the property described above is apparent good order, except as noted (quantity and condition of packages unknown), marked, counted and certified as indicated above which said carrier (the word carrier being understood through this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery or to the destination. If en route, otherwise to another carrier or to a place to said destination, it is mutually agreed as to each carrier at all or any of said property, over all or any portion of said route to destination and as to each party at any time interested in at or any said property, that every service to be performed hereunder shall be subject to all the Bill of Lading terms and conditions in the governing classification on the date of shipment. Shipper hereby certifies that he is familiar with all the Bill of Lading terms and conditions in the governing classification on the date of shipment.
